THE BLACKMAN VENTILATING CO., LD.,

Having acquired an extensive and special experience in handling many thousands of successful Installations for Mechanical Ventilation, invite correspondence from Committees, Architects, Builders, and others who are practically interested, and will be glad to forward printed matter to any address, and to submit Schemes and Estimates for

WARMING AND VENTILATING

any proposed or existing building.
All difficulty in the employment or transmission of power, to any part of a Building, wherever Electric Current is available for driving, can be avoided by using the

ELECTRIC BLACKMAN,

Or BLACKMAN FAN and ELECTRIC MOTOR combined (Watel's Patent).

Besides this it facilitates distribution of effect, and is extremely economical in working.

BUILDING AND BUILDERS.

THE Warwickshire County Council have decided on the enlargement of the Pauper Lunatic Asylum at Hatton, at an estimated cost of 38,000l.

At Halifax it is proposed to transform the Riding School, St. John's Lane, into a concert hall, erecting an orchestra, gallery, &c., and providing new approaches. There will be a large sitting accommodation, and it is believed the acoustic properties will be satisfactory.

THE Dee embankment, extending for some miles from Flint to Holywell, and beyond, has been seriously threatened at a point near Flint. Some time back the channel taken by the tide was found to be changing its course towards the embankment or cop. It first struck the refuse-tip of the Flint Chemical Works, and in the course of a few days washed away thousands of tons. It then ran against the embankment, and speedily the groins and foundations were exposed. This cop not only prevents the flooding of many hundreds of acres of land, but is the only barrier for the protection of the main line of railway

from Chester to Holyhead. The London and North-Western Railway Company immediately laid a trainway from their system right along the cop, and put on a large gang of men, who are strengthening the embankment with 100 tons of stone daily.

PLANS have been submitted to the Coventry School Board by Messrs. G. & J. Steane, architects, for proposed additions to Spon Street Schools, consisting of class-rooms for the accommodation of 120 children.

WHILE the rebuilding of St. Paul's Church at Palfrey, Walsall, is in hand, it has been decided at the same time to build a mission-room for the district, at a cost of about 900l. or 1,000l. A committee has just been appointed to carry out the work.

SOME forty or fifty stonemasons have come out on strike at Halifax. They were engaged on the new infirmary and the new markets, along with a small number of non-society men, and the strike is said to be due to the fact that the masters would not compel the non-society men to join the union.

THE thorough reparation of and rearrangement of seats, &c., in Clarboston Church, Pembrokeshire, has been desired for some years. Sir Owen H. P. Scourfield, Bart., and the rector of the parish have authorised the first instalments of the work, which was commenced this week. Substantial new roofs, of which the main beams will be oak, will be provided. The wooden windows will be replaced with stone traceried windows, glazed with strong ornamental glazing, and fitted with gun-metal casements. The seats, fitting, &c., will be done by instalments, as funds become available. The present contract will be carried out by Mr. G. Rowland Jones, Milford Road, Haverfordwest, under the direction of Messrs. Kempson & Fowler, of Llandaff and Cardiff.

At a meeting of the committee for the restoration of St. Mary's Chapel, Aberdeen, the report by the architects, Messrs. A. M. Mackenzie, A.R.S.A., G. G. Jenkins and William Kelly, was considered and adopted. The expense of the alterations is estimated at between 600l. and 700l. The Marquis of Huntly, in moving the adoption of the report, referred to the historical connection of the chapel with his family, it having recently been discovered that Elizabeth Gordon, the surviving daughter and heiress of Adam Gordon, founded and endowed the chapel, and lies buried within it; and that Sir John Gordon, a suitor for Queen Mary's hand, was also interred in the chapel.

VARIETIES.

THE general works sub-committee of the Coventry City Council recommend the erection of a refuse destructor on the ground at the rear of the new baths, at a cost of about 6,000*l*.

THE death is announced of Mr. Tom Gledhill, A.M.Inst.C.E., surveyor to the Heckmondwike Local Board, at his residence, Church Street, Heckmondwike. Mr. Gledhill was sixty-three years of age, and had held the appointment under the Board—originally as a working surveyor—for twenty-eight years, and under his direction the town's internal drainage scheme and sewage disposal works were being proceeded with.

CONSIDERABLE progress is being made with the extension of the Wet Dock at Alloa. One of the cofferdams has been constructed and the necessary excavations are being pushed forward, and when completed and the channel in front deepened, vessels of a greater draught than hitherto will be able to pass into the dock. Messrs. Young & Son, Edinburgh, are the contractors.

SATISFACTORY progress is reported by Messrs. Maxwell & Tuke regarding the erection of the Blackpool tower, which is now 203 feet 6 inches high, with the exception of a few braces. The rivetters are following up the work rapidly, and if all goes well the tower will be completed within the specified time. The electric crane, the first of its kind ever made, is lifting eighty-five tons a week. Up to April 22 the total amount of iron and steel erected was 1,613 tons. The buildings are being rapidly pushed on.

A LOCAL Government Inquiry has been held at Middlesbrough with reference to the application of the Tees Port Sanitary Authority to borrow 7,000*l*. for the provision of a

cholera hospital on the Tees. The hospital is to be similar to that on the Tyne, and will accommodate twenty beds.

AT a special meeting just held, the Runcorn Board of Improvement Commissioners decided to purchase the Runcorn, Weston and Halton Waterworks Company for the sum of 67,500*l*. The Commissioners propose to expend several thousand pounds in connecting the town with the Vyrnwy main of the Liverpool Corporation.

THE members of the York Architectural Association have just held the concluding meeting of the session, when a paper was read by Mr. John Ferguson, entitled "Strains in Girders, Roof Trusses, &c." The chair was occupied by the past president, Mr. A. Pollard. The lecture was illustrated by diagrams. A discussion ensued, and votes of thanks were passed to the lecturer and the chairman.

WE are reminded of the thoughtful enterprise of the Local Board for Hornsey in establishing a museum of sanitary appliances by receiving the excellent catalogue which has been prepared under the direction of Mr. T. de Courcy Meade, M.Inst.C.E., engineer to the Board. Mr. de Courcy Meade has also been asked to furnish explanatory notes, which will be issued in pamphlet form. This will make the institution doubly valuable as a factor in sanitary education. In addition lectures on hygiene have been promoted by the Middlesex County Council, and classes are held under the auspices of the Plumbers' Company.

A YACHT, built for the Prince of Wales, has been launched at Partick. The saloon has been decorated from the designs of Mr. T. L. Watson, F.R.I.B.A., Glasgow.

THE Worcester City Council have decided to borrow another 9,000*l*. for carrying out their electric lighting scheme.

A LAW has been passed, the *Engineering News* of New York says, by the New York State Legislature, appropriating 30,000 dols. for a topographical survey and map of the state, to be made by the state engineer, co-operating with the director of the United States Geological Survey. This appropriation of 30,000 dols. is for the present year. Of this amount, 6,000 dols. will be spent by the state engineer for determining and marking town and county boundaries, and 24,000 dols., with an equal amount from the United States Geological Survey (or 48,000 dols. in all), will be employed in making a topographical map of the state, similar to those already made of Massachusetts and Connecticut. There will be 5,000 square miles mapped this year, on a scale of 1 mile to 1 inch, with 20 feet

contours. This will be distributed over different parts of the state, including the Adirondack region.

WE are informed that Mr. W. E. Ommanney, of 185 Victoria Street, S.W., is now very busy in electric light installation work, the following works having been successfully completed:—Messrs. Hunt, Cox & Co., 29 Threadneedle Street, E.C.; Miss Anderson, 39 Craven Hill Gardens; White House, 15 Somers Place; 9 Radnor Place, W., for Mrs. Younghusband; the Old Three Tuns, 5 High Street, Kensington; Mr. F. Wilkins, 11 High Street, Kensington, and several extensive additions for large houses in the neighbourhood. Additions to 19 Kensington Court, for Mr. P. E. Singer; 28 Hyde Park Gate, for Lady Laffan; No. 1 Hyde Park Gate, for Mr. H. Edgell Hunt; No. 4 Queen's Gate, S.W., for Mrs. Alexander Staveley-Hill; No. 4 Palace Gate, W., for Mr. P. Hardy, &c. Victoria district.—Complete installation for 185 Victoria Street, S.W., for the Home of Rest for Horses, and for the Cabmen's Shelter Fund; additions and alterations for Messrs. Wilkes Bros., Buckingham Palace Road, S.W.

TRADE NOTES.

THE contract for the erection of the building of the Industrial Exhibition at Bristol has been secured by Mr. A. Krauss, of Bristol, for the sum of 9,985*l*.

THE County Buildings Committee report, just adopted by the Warwickshire County Council, recommended the acceptance of Mr. J. Bowen's tender for 8,160*l*. for the erection of new police courts at Aston.

VARIOUS contracts for the erection of a new mission church at Eldwick, near Bingley, have been let as follows:—Mason and joiner's work, Messrs. Wm. Ives & Co., Shipley; plastering, Mr. Henry Spurr, Bingley; slating, Mr. Wm. Thornton, Bingley; plumbing, Mr. John Hodgson, Keighley; painting, Mr. J. W. Anderson.

THE Gas Committee of the Leeds Corporation have accepted the following contracts for the ensuing year:—Stanton Ironworks Co., pipes; Messrs. Rhodes Bros., flags; Messrs. W. Hepton & Son, brass main cocks; Ribblesdale Lime Co., lime; Messrs. J. Bowling & Co., castings. The contract of

Messrs. J. E. Binns & Sons was accepted for the erection of a new governor house at Dewsbury Road.

THE Victoria Ironworks, Walsall, formerly carried on by Mr. H. Mills, and now the property of Messrs. Walker, of Dudley and Walsall, have been closed in consequence of the low price of iron and the high price of coal. The stoppage is only to be a temporary one, but nearly two hundred men are thrown out of employment by it, and other works in the neighbourhood are said to be contemplating a similar step.

THE new offices for the *Morning Post*, London, are being warmed and ventilated throughout by means of Shorland's patent Manchester grates and patent Manchester stoves, supplied by Mr. E. H. Shorland, of Manchester.

A NEW system of improved ship ventilation has recently been invented and introduced by Messrs. Baird, Thompson & Co., the well-known ventilating engineers, of London and Glasgow, which, having been subjected to the most severe tests, has proved so successful that it has already created quite a sensation in scientific and sanitary circles, receiving the approval and commendation of the highest authorities. In actual practice it has proved, if possible, even more successful, and one of the principal Atlantic steamship lines, after trying it on one of their vessels, have already adopted it for the whole of their fleet, instead of the existing systems, at a contract price of 100,000*l*. (one hundred thousand pounds). To well-appointed passenger vessels its application may only mean the additional luxury of an abundant supply of fresh air under all conditions; but to emigrant ships it is an absolute necessity, as with no system can the evils of over-crowding be so mitigated as to maintain a clean bill of health, by keeping the atmosphere 'tween decks in a constant state of purity. For cattle ships no system is so efficient and economical, as with it live-stock cargoes are greatly increased in value, owing to fewer casualties and to their arriving in better condition, while with fruits and other perishable freights the saving is enormous. For the "Baird-Thompson" system it is claimed that it is the most efficient, economical and reliable, and this, indeed, appears to be the case, seeing that even its opponents admit it is amongst the most satisfactory, and that it has many and decided advantages. A full description of the system and appliances is given in the catalogue Messrs. Baird, Thompson & Co. have recently issued dealing with ship ventilation, and in it is also quoted the opinions of our most prominent contemporaries, such as the *Times*, the *Lancet*, &c., all of which are highly favourable.

PRICES AND PARTICULARS ON APPLICATION.

JAMES HILL & CO., 100^A QUEEN VICTORIA STREET, LONDON, E.C.

MESSRS. LAING, WHARTON & DOWN, of 82A New Bond Street, W., have just received the contracts for electrical installations, or other electrical work, at the following places:— Extensions at the Devonshire Club, St. James's Street; the premises of Messrs. Willington & Pollard, 278 Strand; extensive alterations for Dr. Coffin, at Whitehall Court; Sir C. Tennant, Bart., 40 Grosvenor Square; Dr. Wingfield Bowles, 16 Upper Brook Street; an electric pumping plant, for Sir Philip Rose, Rayners; the Capital and Counties Bank, Limited, Threadneedle Street; Messrs. Peek, Winch & Co., 4 Fenchurch Street; Messrs. Turner & Hacon, Leadenhall House; the National Bank, Old Broad Street; the Eastern Telegraph Company, Old Broad Street; Messrs. Brunton, Bourke & Co., 18 Finch Lane.

MESSRS. BAIRD, THOMPSON & CO., of Queen Victoria Street, E.C., and Bath Street, Glasgow, the well-known ventilating engineers, have just issued their new illustrated price-lists, which are of a very artistic character and calculated to give the reader some idea of the inventions and improvements that the company has achieved in the present as in past years. Ventilation, a sanitary necessity, is brought by the efforts of Messrs. Baird, Thompson & Co. to a state of perfection, involving as it does no unsightly appliances. The ornamental turrets, of which we are favoured with a multiplicity of designs in nearly every style of architecture, are constructed to carry away heated and vitiated air from any building without down-draught, and are truly artistic and decorative. The quality of the materials and of the workmanship used in the carrying out of these designs is sufficient guarantee for their durability. The new turret ventilators possess another virtue, and one which will prove not an unimportant factor in the sum of their certain popularity, this is, their economy. Being, as these designs are, efficient, economical and decorative, we cannot be mistaken in predicting for them an assured, if not brilliant success, and we should advise any one who contemplates ventilating a building to send for one of Messrs. Baird, Thompson & Co.'s illustrated catalogues.

MESSRS. R. & W. WINFIELD, Limited, have appointed Mr. Seymour Cremen, late manager to Messrs. F. W. Reynolds & Co., of Southwark, to the charge of their London business from May 1.

DROYLSDEN SEWAGE DISPOSAL SCHEME.

SCHEMES for the disposal of the sewage of town after town in the Manchester district are being rapidly pushed forward, in view of the determination of the authorities not to allow pollution of rivers and streams falling into the Manchester Ship Canal.

A Local Government Board inquiry has been held by Mr. Samuel J. Smith, C.E., into an application of the Droylsden Local Board for sanction to borrow 28,000*l.* for works of sewerage and sewage disposal.

The town clerk of Manchester and the city surveyor watched the proceedings on behalf of the Corporation, but explained that they were not there to oppose the scheme. The clerk to the Local Board said that at present the sewage passed into a stream which emptied itself into the river Medlock, and they proposed to purify it in order to produce a comparatively pure effluent. The Board had visited several places to ascertain the best process, and with their medical officer of health came to the conclusion that to deodorise and precipitate with ferozone, and finally filter through polarite filters, would be the best.

Mr. Washington Hurst, engineer to the Board, entered into further details as regards the scheme, and stated that the outfall works would consist of six tanks, having a total capacity of 600,000 gallons, and eight polarite filters, with 3 acres of land below, which could be used if desired.

Mr. Hurst explained that without polarite beds the area would not be enough, but plus them it was quite sufficient. The site proposed for the outfall works is rather low, but the clerk stated that negotiations with a landowner in the district were in progress, which, if carried out, would obviate the difficulty. The scheme also provides for a destructor.

The inspector subsequently took evidence as to the borrowing of money for the purchase of land for a recreation-ground, cemetery and town's yard, after which the inquiry terminated.

The scheme proposed for purifying the sewage of Droylsden is the same as that adopted by the neighbouring Local Board of Gorton, who have also applied to the Local Government Board for a loan to carry out their works.

The illustration shows a heavy-duty metal filing cabinet with its lid open. The interior is organized into several sections. At the top, there are two large drawers labeled 'PRIVATE LETTERS' and 'RECEIPTS'. Below these are several smaller compartments labeled 'PAID GIVING ACCOUNTS', 'PAMPHLETS', and 'LETTERS'. A hand is shown placing a document into one of the compartments. The cabinet has a sturdy metal construction with a visible lock mechanism on the front. The lid is also labeled 'SAYLOR'.

reduce professional worries as much as possible to invest in one of the tables, and insure any amount of convenience and comfort. We would add that the boxes, cabinets, tables, &c.,

are highly finished; that the best Yale locks are used in them and that the price is extremely moderate. Mr. Bowater Vernon's offices are at Albany Buildings, 39 Victoria Street, S.W.

THE CENTRAL RAILWAY, GLASGOW.

By an arrangement between the Parliamentary Bills Committee of Glasgow Corporation and the Caledonian Railway Company with reference to the Central Underground Railway, the Corporation give consent to the company appropriating and enclosing the portion of the open space at the Cross for the erection of a station not exceeding one storey in height, the building not to occupy more than 100 square yards. The plans of the station are to be adjusted between the city engineer of Glasgow and Mr. J. J. Burnet, architect, and in case of

difference by Mr. James Thomson, architect. The Corporation also agree to the acquisition by the company for ventilating purposes of property on the south side of the Trongate, with the stipulation that on the street frontage they shall erect a screen wall of suitable height and architectural design to harmonise with the street façade of the new buildings of the Corporation in Trongate. The design is to be determined by the gentlemen already named. There is also a stipulation that screen walls be erected on the line of the street where any other properties are similarly acquired throughout the city for ventilating purposes. The Corporation agree to certain extensions of time for the completion of the railway, in return for which the company grant several concessions as to the street and other improvements.

A MODEL GLASGOW FACTORY.

IN days when the factory worker is hedged by Acts of Parliament and guarded by a Government Department from the evil effects of trade competition, some extra credit is due, the *Glasgow Herald* says, an employer who makes improvements beyond the contemplation of either. In the fitting-out of their William Street factory Messrs. Arthur & Co., Limited, have done this. They have reduced the danger from machinery to a minimum and vastly improved the place from a sanitary point of view—shown, in fact, exactly how much perfection in these respects is compatible with commercial success. The building is 280 feet long and 40 feet broad, and there are five floors and a basement; but as a central wall, fitted with fire-proof doors, divides the establishment into two sections, there are practically ten flats. To the hundreds who toil in these spacious apartments, fashioning garments for every description of mortal, Hood's famous poem is rather a pointless production. There is no weary stitching—hardly any drudgery here. Rows upon rows of sewing machines driven by steam, and deftly controlled by well-cared-for young women, rattle through most kinds of work at the rate of from 1,600 to 1,800 stitches a minute. Circular knives cut layers of material into certain shapes indicated in chalk on the uppermost lengths, and perform the work so expeditiously that the supply is oftener over than under the demand of the hundreds of workwomen.

This magnificent Illustration was presented to the Subscribers to "The Architect" in 1886. A few Proofs were taken, which immediately became out of print.

P. A. GILBERT WOOD, 175 Strand, W.C.

Machines of the ordinary type with equal precision put the pieces together and, roughly speaking, give the things some form, and then they are passed over to where ingenious contrivances which represent the highest development of the sewing machine are constantly doing nothing less than slitting and finishing button-holes and sewing on buttons. Naturally, nothing is soiled in a process so purely mechanical, and the finished goods are as absolutely clean as the material was at the commencement. For certain manufactures of course a visit to the laundry is necessary, but even in that department the stay is of the briefest, everything possible being done there, as elsewhere in the building, to facilitate the process of production. With so much machinery in motion the danger to life and limb is obviously great, yet in Messrs. Arthur's establishment the possibility of serious accident is always remote. The pulleys, shafts and belts are protected in such a manner that a break anywhere could have no more serious consequence than a temporary cessation of work. The necessity, too, for stopping the machinery in an instant when danger is apprehended is provided for, the smashing of a small glass disc conveniently placed on the walls of the more important flats automatically bringing to a standstill practically the whole establishment. A reversal of the same electrical arrangement downstairs throws the engine out of gear instantaneously, and a governor, which ought to form part of the equipment of every engine, automatically prevents racing. On the boilers there is a remarkable arrangement styled a "steam loop," which tends to economise fuel by enabling the firm to re-use what would otherwise be waste steam. The principle embodied is certainly opposed to engineering practice, or engineering practice rather ignores it; but the invention exists and—Messrs. Arthur say—to some purpose. In striving in these directions to facilitate labour the firm did not lose sight of the fact that a great deal still depended on the provision of healthy quarters for their workpeople. Everything that could be done to make the place bright and sweet was done. Recently electricity as an illuminant displaced gas, and only the other day the Sturtevant system of heating and ventilating, which has proved highly successful in America, was introduced. Briefly described, the system consists in the massing of steam pipes in peculiarly constructed coils, and the locating of them, enclosed in steel-plate jackets, in the basement of the building or some other convenient point. The fresh air to be heated is taken from out of doors, passed by means of a Sturtevant fan across the surface of the steam coils, and then distributed in the building through

properly proportioned ducts built into the walls, or metal pipes provided for the purpose. Previous to being drawn or forced through the heater the air is passed through a filter screen in order to remove atmospheric impurities, and at this point, when circumstances render the process advisable, it is moistened and washed to increase in some degree the humidity, which will be affected by the rise in the temperature and also to procure absolute freedom from smoke or dust particles. As the air is introduced into the building under slight pressure all leakage is necessarily outwards—a feature which, considered in connection with faulty sewers and drains, is important from the sanitary point of view. In Messrs. Arthur's place the best arrangement possible was to lead a large vertical brick-built flue, narrowing as it passed each floor, and parted with a proportion of the heated air, from the fan-house in the basement to the attic floor on either side of the dividing wall. From these vertical flues air is distributed to each floor according to the number of workers on it. The displacement necessary to perfect ventilation varies, of course, with the nature of the employment and other circumstances, but it may be affirmed generally that no scheme is satisfactory which does not provide hourly for each worker at least 2,000 cubic feet of perfectly fresh air. In this factory there is accommodation for 1,000 workers, and the air which the heating apparatus is capable of supplying is considerably in excess of the quantity necessary according to this calculation. The apparatus has been supplied by the Sturtevant Blower Company, and consists of a fan 7 feet in diameter and 4 feet in width, driven by a direct connected engine with steam cylinders 7 inches in diameter and a 10½-inch stroke. The heater, which is made up of six separate sections and derives the whole of its heat from the exhaust steam of the main engine, consists of over 3,000 lineal feet of steam pipe, all enclosed in a steel-plate jacket, and together with the fan and engine, covers a floor space not exceeding 13 or 14 feet square. On winter mornings the fan is started half an hour before the factory opens, and with a temperature outside below freezing-point, the workers find themselves on entering the building in a comfortable atmosphere of about 60 degrees. This temperature is maintained with hardly any variation during working hours, and in that time the fan also discharges throughout the different floors a continuous stream of over two million cubic feet of pure warm air and displaces an equal quantity which has become vitiated. In every other respect, it is almost unnecessary to add, the factory is thoroughly and completely up to date.

MANSFIELD STONE,

FROM THE "LINDLEY" QUARRIES,
MANSFIELD.

A CURIOUS BOULDER.

A CORRESPONDENT of the *Manchester Guardian*, Mr. S. M. Morley, writes:—

It may interest many of your readers, and especially those who take a delight in geology, to hear that during the past week a boulder of considerable size has been unearthed at Eccles. The discovery was made by workmen engaged in digging for a foundation for a house, the site being at the top of Sandwich Road, Ellesmere Park. The owner of the premises is Mr. Willis, of Eccles. This erratic block, which is composed of granite, is about 27 cubic feet in dimensions, and weighs, perhaps, a little short of three tons. The granite is light in colour, owing to a preponderance of quartz—the felspar of a light reddish brown, the mica black. The stone, if polished, would present a very beautiful appearance, being bright and crystalline in structure. Those amongst your readers who are more or less acquainted with what rough outline geology affords of the past history of our earth will, of course, be able to conjecture by what mode of transit this boulder has got to the place in which it was found, even though the question "Where has it come from?" proves too much for them. Would that this "silent witness" of past ages had a voice to tell its own story, for its secrets must be such as neither poet nor philosopher ever dreamed of—more wonderful than any adventure we ever heard, more thrilling than any romance we ever read. For the convenience of those to whom the earth's past is a locked-up secret, I make the following remarks concerning the boulder of which I am writing. It is possible that this boulder once formed the head of some steep, towering pinnacle, situate, perhaps, on the Isle of Arran; or it may be that its ancient home was Criffell, and that for centuries it looked down upon what is now the Solway Firth. It is certain that during some part of the glacial period, possibly at a time when a vast glacier extended from the North Pole to England, and the greater portion of our island was covered with a thick coating of ice, this boulder, yielding to the attack of the elements, fell from its original position, and came to rest on the ice that lay beneath. This ice, shifting in accordance with glacial action, conveyed the boulder to the edge of the sea, and upon the ice breaking up under the influence of the increased temperature of the northern part of the globe the portion of the glacier bearing the boulder became detached and floated at large upon the

Irish Sea. At this time the whole of Lancashire would be lying beneath the ocean, and the iceberg conveying our boulder must have been carried by wind and current into the locality we now call Eccles. The iceberg, gradually melting, dropped its burden in the place where, during the present week, it has been found. I understand that Mr. Willis intends to offer the boulder to the Peel Park Museum Committee.

TALL BUILDINGS IN AMERICA.

ACCORDING to the *Engineering Record* the Masonic Temple, Chicago, has twenty floors above ground and a height from sidewalk to roof coping of 274 feet. The Pulitzer Building, New York City, occupied by the *World* newspaper and by offices, has twelve storeys above ground in the main structure, with a roof 191 feet above the sidewalk. On the top of this, however, is a six-storey dome, in which the highest standing room is 280 feet above the ground. The New Netherlands Hotel, New York, now approaching completion, will have seventeen floors, and reach to a height of 210 feet above the sidewalk. Among the newer buildings erected in Chicago are the Katahdin and Wachusett, each of seventeen storeys, and 200 and 205 feet high respectively from the sidewalk to the top of the roof. The Old Colony, another seventeen-storey building, will be 215 feet high from sidewalk to roof. The Hartford and the Ellsworth buildings, each of fourteen storeys, will be respectively 165 and 170 feet high from sidewalk to roof. The law relating to buildings in New York City imposes no restrictions upon the height of buildings for office purposes. An older law, limiting the height of dwelling-houses in New York City, prescribes their height in accordance with the width of the street upon which the buildings front. On streets and avenues not exceeding 60 feet in width the height shall not exceed 70 feet, and on streets and avenues exceeding 60 feet in width, the height shall not exceed 80 feet. The Chicago building ordinance adopted last month establishes the maximum height of buildings at 130 feet. The State law relating to the construction, main enance and inspection of buildings in Boston, which went into effect last year, fixed a maximum height of 125 feet for all buildings except the spires of churches, and further restricted the height to two and a half times the width of the widest street or square upon which they stand, measured from the face of the building to the street-line upon the other side.

THE STOREY INSTITUTE, LANCASTER.

THE Free Library Committee of the Lancaster Corporation have been visiting the libraries and other places in the town with a view to secure a building in which they might temporarily lodge the public library, or otherwise fix upon a site for the erection of a building in order to carry out the purposes of the Public Libraries Acts, recently adopted by the ratepayers. As a result, it was decided to negotiate with Sir Thomas Storey for the use of the library and reading-room of the Storey Institute as part of the scheme for putting in force the Acts. Sir Thomas Storey has replied to the Corporation, and expressed his pleasure at the progress made in the way of technical and scientific instruction in connection with the Institute, pointing out that at present the whole of the educational work of the Institute was in the hands of the Town Council, including the science, technical and art classes. He had come to the conclusion that he would be best carrying out the local Act of 1886 and the wishes of the trustees of the old Mechanics' Institute, on the site of which the present Institute stands, by transferring to the Corporation the whole of the Institute, with its pictures, statuary, furniture, laboratory and apparatus, library and fittings. After a brief discussion the Town Council unanimously decided to accept the generous offer of Sir Thomas Storey, and to carry out his conditions, which they considered exceedingly simple. They were that compensation should be given to Mr. Turpin, the principal of the Institute, in case his services should be no longer required, and that Sir Thomas might have occasional use of the rooms on the basement for social purposes. A committee was appointed to arrange the details of the transference of the Institute to the Corporation. The Storey Institute, opened by the Duke of Devonshire on October 23, 1891, may now be regarded as given to the public of Lancaster. It is estimated that it cost between 20,000*l.* and 25,000*l.*

THE BIRMINGHAM BATHS.

DURING the past winter several improvements have been accomplished in some of the baths which are under the control of the Corporation of Birmingham. It may not be generally known, says the *Daily Post*, that the water used in the various departments is obtained from deep wells sunk upon the premises of each establishment. This arrangement necessitates a complete plant, large enough to raise the 100,000,000 gallons of water used every year and to heat the greater portion of

it to various degrees of temperature, varying from 76 degrees in the swimming-baths to 212 degrees in the private baths. The alterations recently carried out have principally affected the Kent Street and Northwood Street baths. At Kent Street the old corrugated iron roofing over the first-class swimming-bath has been removed, owing to its decayed and unsafe condition, and has been replaced with a new lantern roof, forming five bays, supported by the original principals. For purposes of ventilation, in place of the louvre boards two rows of clear fluted glass windows have been provided with suitable casements on each side, regulated by gear-work from the bath-room below; while two large archimedian ventilators have been added with tubes of 24 inches diameter and a height of 7 feet above the ridge. These are connected by means of wooden flues to gratings fixed in the ceiling, and each grating has an area of about 12 square feet. Means have been taken to prevent the action of the sun's rays upon the water, which has been a source of trouble by causing vegetation or other discolouration of the water. The committee have had the promenade round the bath, together with the floor of the side corridors, laid with Edwards's Ruabon adamantine quarries, bordered on each side of the promenade with coloured tiles, terra-cotta, buff and black. This pavement, which has a neat and pretty appearance, will be much more satisfactory to the bathers than the old blue-brick paving, which had become full of holes and hollows. The sanitary arrangements have also been considerably improved, and the whole department, including the entrance corridors, passages and dressing-rooms, has been thoroughly cleaned and painted. Round the walls between the dressing-room doors there are ornamental brackets, supporting pots of shrubs, and the statuary removed some time ago from the glass pavilion at Aston Hall still remains. For the greater comfort of bathers during the winter a new system of steam heating has been adopted for warming the atmosphere of the bath and dressing-rooms. There is upwards of 650 square feet of heating surface. Bathers may now obtain a comfortable winter swim free from the cold draughts and chilling atmosphere hitherto experienced. The water will be of equal temperature with the air. The alterations at Northwood Street have been of a different character. Here for some time past complaints have been made of the low temperature of the water in the swimming-baths, and the occasional want of sufficient hot water to meet the demands of bathers in the slipper baths. The committee have inaugurated a new and satisfac-

H. AUSTIN, Florence Works, Armley, LEEDS.

tory system. Instead of the old hot-water and steam boilers, of which there were three of the former and two of the latter, they have put in two large steam-boilers, specially designed by their engineer for the purpose. Each is of sufficient power to do the whole work of the establishment, including the supply of necessary steam-power to the pumping-engine, the heating of water in the swimming-baths, and the provision of hot water for about seventy private baths. They will work alternate months, so that they may undergo frequent cleaning and repairs. They were made to specification by Mr. Edwin Danks, of Oldbury, and they are fitted with the most modern and approved gauges, valves and fittings, obtained from selected manufacturers. To each of the boilers are attached one 3-inch and one 4-inch bore steam service main, the former supplying the pumping-engine and the latter the various heating appliances. In place of the old hot-water boilers a specially-constructed steam-heating instrument has been connected to each of the swimming-baths, whereby the water is extracted from the deep end of the bath, conveyed to the heater, and returned into the bath at the reverse end, thus creating a steady and constant flow of tepid water through the bath, and maintaining the whole body of water at a uniform temperature of from 70 to 76 deg., as may be required. In addition to this a new steam-heater of special design has been introduced in the service pipe between the cold-water service tank at the top of the buildings and the inlet pipe of the bath; so that on all occasions when the attendant has to put fresh water into the bath (generally from 20,000 to 30,000 gallons a day) he can do so at a temperature of 74 deg., or higher if required, instead of at 48 deg., as formerly. The hot water supply to the private or slipper baths has been constructed on the same principle, with the addition of a large reserve hot-water tank, containing about 600 gallons of water, heated either by "live steam" direct or by steam circulation, according to the demand made upon the tank. To accommodate these new boilers a boiler-house, about 44 feet long by 22 feet in width, has been erected in the yard adjoining the old boiler-house. The old boilers were in the basement; the floor of the new boiler-house is on a level with the roadway and is covered with a light lantern roof. At the Monument Road establishment the committee have determined to discontinue the use of the wood foot-racks forming a portion of the floor round the promenade of the first-class swimming-bath, and to replace them with ribbed tiles. Wood soon gets rotten with the constant wet. The same change will be made in the first-class swimming-

bath at Northwood Street in due course. It is satisfactory to know that by the introduction of the new system of steam-heating at Northwood Street (rendered necessary by the unsound condition of the old boilers and the inefficient system referred to), that a considerable saving of fuel will be effected. This was found to be the case at the Kent Street establishment after a similar reconstruction in 1887. The committee are also gratified to find that in neither case have the original estimates of expenditure been exceeded. The changes have been designed and carried out by the committee's engineer, Mr. J. Cox, general superintendent.

PATENTS.

[This List of Patents is compiled specially for this Journal by Mr. G. H. Rayner, of the firm of Rayner & Co., Consulting Patent Agents, 37 Chancery Lane, London, W.C., from whom all particulars and information relating to Patents may be had gratuitously.]

APPLICATIONS FOR PATENTS.

7306. George Josiah Body, for "Body's patent metallic double-rebated and tongued sashstile for the pulley and pivot principle."

7309. Ralph Bradley Cockcroft, Joseph Bradley and William Ward, for "Improvements in fastenings, whereby window-cords may be secured to the stiles of window-sashes."

7315. Edith Bowen Penn, for "Improvements in window-fasteners."

7326. James Marshall, for "An improved fire-alarm."

7382. Joseph Shaw, for "Improvements in ventilators for the escape of foul or heated air from rooms or buildings."

7412. Edwin George Warner, for "Warner's unbreakable tap or valve."

7425. Frank Hine Willis, for "Improvements in the construction of fireproof floors."

7427. James Rodgers Coker, James Sett and Samuel A. Rodgers, for "An improved portable fire-escape."

7459. Joseph Clulow Jackson and Joseph Ogden, for "Improvements in or connected with cage-hoist doors."

7473. Joseph Shaw, for "Improvements in ventilators."

TO INVENTORS.—Patents for Inventions, Trade-marks and Designs secured; every assistance given to inventors. Specialists in Building matters. Information free.—Messrs. RAYNER & CO., Patent Agents, 37 Chancery Lane, London, W.C.

TRADE NOTES.

MESSRS. LAING, WHARTON, & DOWN, of 82A New Bond Street, W., have just received the contracts for electrical installations, or other electrical work, at the following places:—Messrs. Collier Bros., Essex Brewery, Walthamstow; Messrs. Hohler & Co., 26 Birch Lane; additions for Mr. Tom Brown, 48 Conduit Street; premises of Messrs. Redfern, 26 and 27 Conduit Street, requiring some 500 lights.

THE Leeds Mercury says that the steelworks in Staffordshire have announced that so large is the present demand for steel of all descriptions that they could double existing contracts if prices permitted to compete with Scottish and Cleveland makers. Bridge plates have been dropped to 5*l.* 15*s.* and 6*l.*; large bars 5*l.* 10*s.* and channels 6*l.* Brooms are 4*l.* 5*s.* and boiler-plates 6*l.* 10*s.* Cleveland steelmakers are sending Bessemer plating bars into the Midlands at 5*l.* 10*s.* to 6*l.*, and are taking many orders.

THE Chertsey Rural Sanitary Authority, at their meeting on April 25, accepted the following tenders for the sewerage

and sewage-disposal works for Weybridge and Oatlands:—Mr. John Jackson, The Laurels, Broadway, Plaistow, London, E., for the general contract for the construction of sewers, pumping-station and precipitation tanks (26,500*l.*); the Stanton Ironworks Co., Limited, near Nottingham, for the supply of iron pipes, special castings, and other ironwork in connection with the above works (6,710*l.* 11*s.* 8*d.*); Messrs. Davey, Paxman & Co., Colchester, for the boilers and pumping engines (2,900*l.*); Messrs. Manlove, Alliott & Co., Limited, Nottingham, for the mixing and pressing machinery at the disposal works (1,514*l.* 2*s.*)—the total amount of the contracts being 37,624*l.* 13*s.* 8*d.* Mr. W. H. Radford, C.E., of Nottingham, is the engineer to the works.

A STRIKE of bricklayers and labourers has begun at Brighton and Northampton. At Stockport a strike of operative masons has taken place.

An illustrated catalogue of sanitary specialities, including cottages, w.c.'s, latrines for schools, workshops, &c., gullies, traps, &c., has just been issued by Messrs. J. Duckett & Son, Limited, of Burnley, Lancashire. The merits of the automatic slop water-closets can hardly be exaggerated, and since their introduction the demand has steadily increased for them, also the excellent Duckett's self-cleaning channel gulleys. One elaborate feature of the catalogue is that the illustrations given are so precise in their details as to become equivalent to expensive working drawings. We can strongly recommend this catalogue to the inspection of all interested in sanitary appliances.

WE have lately inspected the steam turnery works of Messrs. H. J. Budd & Co., 96 Holloway Road, N. Every description of turnery—balusters, newels, handrails, &c.—are manufactured by the firm in the best possible manner and with despatch. We can confidently recommend buyers of this class of goods to communicate with Messrs. H. J. Budd & Co., for designs and prices.

WE notice that Mr. Joseph Taylor, lately a member of the firm of Messrs. Taylor & Tucker, Limited, has commenced business on his own account at 42 Lamb's Conduit Street, W.C., as manufacturer of art metal-work, gas and electric light fittings, &c. Mr. Taylor is so favourably known as making a speciality of high-class work, that we have no doubt that orders entrusted to him will give satisfaction. Mr. Taylor is patentee and manufacturer of a patent combination table pillar, which can be used as a bracket or for lighting pictures,

BEST PORTLAND CEMENT.

"ADAMANT BRAND." Manufactured by

SKELSEY'S ADAMANT CEMENT CO. LD.,

HEAD OFFICES: 121 HIGH STREET, HULL. WORKS: STONEFERRY, HULL, & BARTON-ON-HUMBER.

1a CRESCENT, MINORIES, LONDON E.C.

and can be fixed at any angle by simply moving the quadrant. A pretty Pompeian electric pillar of elaborate design is also worthy of attention. Very commodious workshops at 42 Lamb's Conduit Street, W.C., give every facility for doing work on the spot, with prompt attention to orders. Architects' designs will be carefully followed.

VARIETIES.

THE death is announced of Mr. E. W. Brooking, formerly surveyor to the Barnet Local Board and Rural Sanitary Authority, and afterwards to the Finchley Local Board. Mr. Brooking was a man of great ability as a surveyor and engineer, and will be remembered with esteem by a large circle at Barnet and Finchley.

AT the meeting of the Irwell and Mersey Joint Committee the inspector, Mr. Tatton, presented a report in which he said:—I have inspected the Ship Canal with a view of verifying the complaints which have been made as to the condition of the water. I can fully endorse what was said at your last meeting. The water at the present time is very foul, and the stench from it is abominable. When the canal is filled and the rate of flow is consequently reduced the condition of things will be very bad, and local authorities with schemes of sewage disposal in hand should use their utmost endeavours to get their works in operation by the summer of 1894. By that time the bulk of the Manchester sewage will be treated, and the Salford effluent will, we hope, be improved; but there will still be considerable pollution from towns higher up the rivers whose schemes are only now before the Local Government Board.

THE Drapers' Company have made another grant of 1,000*l.* for 100 scholarships, tenable for three years, at the People's Palace Day Technical School.

THE Paris correspondent of the *Standard* says:—A line of electric tramcars, likely to prove useful to visitors to the French capital, has been inaugurated. The head of the line is just behind the Opera House, whence it proceeds down the Rues Lafayette, Maubeuge, and De la Chapelle to St. Denis.

THE annual meeting of the London and Lancashire Fire Insurance Company has just been held. The report submitted states:—"The directors propose to pay a dividend of 7*s.* per share, free of income tax, making, with the interim dividend of 3*s.* per share already paid, a total distribution of 10*s.* per

share, the same as for the last two years." The director remark that their policy of restricting dividends, which has occasionally been commented on as partaking somewhat of the nature of parsimony, is amply justified by the experience of the past year, as it is owing to the fact of the company's reserves having been increased during the previous three years by no less than 312,741*l.* that they feel themselves justified in recommending payment of the usual dividend.

THE Bromielaw Bridge, Glasgow, designed by Telford, is to be carefully removed and re-erected over the Clyde at Govan Street, with an approach from The Green. The work will cost about 50,000*l.* A wider bridge is about to be substituted for it.

AT Glasgow the Lord Dean of Guild Guthrie Smith has issued an interlocutor in respect of a claim made by the Glasgow Master of Works on the proprietors of Windsor Terrace, in Great Western Road, seeking them to repair the footpath opposite their respective properties. His Lordship dismissed the claim and awarded the proprietors their expenses. He held that what was asked by the Master of Works was most unreasonable and most unnecessary.

A NEW drainage scheme and improved water-supply has been recommended for Stamford by Mr. G. E. Lawford, engineer, Westminster. The cost of the entire drainage scheme is estimated at 54,000*l.*, which includes a 10 per cent. margin for contingencies.

BUILDING AND BUILDERS.

THE *Leeds Mercury* says:—The Corporation Building Clauses Committee have passed eighty-two plans, including several for the opening out of large estates.

THE same paper notices that a Leeds firm has taken out a patent for an improved method of making foundations for roads and buildings. It consists of iron frames with a corrugated centre, the frames being filled with concrete and pinned together, making one continuous foundation.

PLANS have been prepared by Messrs. Beaumont, architects, for the extension of the Manchester Reference Library, the cost of the proposed building being estimated at about 12,800*l.*

A NEW church is to be erected at Bessingly, near Hull, at an outlay of about 3,000*l.*, the cost being met by a bequest made by the late Mr. George Wright, of Bessingly Hall.

ALBERT WORKS, ALBERT EMBANKMENT, LONDON, S.E.

It is stated that Lord Battersea will preside at the twenty-fifth annual meeting of the South London Art Gallery, to be held in the Gallery, Peckham Road, on Tuesday next. He will be supported by Mrs. Burne-Jones, Mrs. Watts and other friends of the Gallery.

THE *City Press* says it has been referred to Mr. G. F. Watts, R.A., as a life-long friend of the late Laureate, to decide the competition for the bust of the late Lord Tennyson to be placed in Guildhall.

A VISIT TO THE POTTERIES.

A PARTY of the Incorporated Association of Municipal and County Engineers, on Saturday, the 29th ult., visited the Staffordshire works of Messrs. Doulton & Co., at Rowley Regis, near Dudley, which are devoted to the manufacture of stoneware pipes, chimney-pots, blue bricks and architectural terra-cotta. These works are the largest of the kind in the kingdom, and, together with the clay workings, cover an area of some 30 acres, and give employment to about 700 men. A canal runs through the works, and this, together with the adjacent railway sidings, affords every facility for the transport of goods. The members of the Association were conducted through the various buildings, and were shown the numerous processes the clay undergoes from the time it is taken from the clay-fields until it issues as the finished product. There are eight large steam-presses at work capable of turning out about ten miles of sanitary pipes per week. Extensive drying-rooms, heated by steam, are used to prepare the pipes for the kilns. The blue brick works are laid out on the most approved principles, and have an output of 100,000 bricks per week. A branch of the works is devoted to the manufacture of the highest class of architectural terra-cotta, and the work in hand shows a very high standard of finish. Special attention is given to the subject of colour, some particularly fine red and plum-coloured blocks being visible.

In connection with these works there are also engineering shops replete with all machines and tools necessary for the production of dies, &c., required for Messrs. Doulton's numerous works throughout the country, and the visitors, in being taken through the pattern-shops, smithy and fitting-shops were shown many machines, &c., in course of preparation.

The steam-power for the works is derived from five large boilers, and the engines are capable of supplying 1,000 horse-power.

the showrooms in Birmingham or in London (No. 62 Holborn Viaduct) will enable our readers to judge for themselves of the meritorious character of these articles. Or, indeed, a fair judgment may be passed on them by consulting the supplementary illustrated trade-lists just prepared by Messrs. Townshend & Co. Great credit is due to the enterprise of Messrs. Townshend & Co. for placing in the market domestic objects of everyday use in so charming a variety of designs at what have been rightly termed phenomenally low prices. In other words, it was only necessary that some one should show

FIG. 2.

it was possible to produce articles of everyday use as cheaply in a form of beauty as has been the case with all useful, but in the main unsightly, requisites. Articles of domestic use are so numerous and varied that it would involve compiling a small dictionary to run through the whole gamut. These may therefore be left without more direct mention. We append some engravings of objects which it will be found are in general

use where ornamental effect is aimed at, which nowadays is the rule rather than the exception.

Fig. 1 is a sample out of several good designs of the "Chic" brush sets for halls of houses, mansions, &c. These useful articles provide for brushes and mirrors, receptacles for matches, and can be furnished also with a dinner-bell. The engraving shows one appliance on an oak shield with brush holders &c., in brass-work. In referring to the hall a mention of fern pots and jardinières is apropos where they exercise with the ferns and flowers they contain so delightful an effect. The jardinière (fig. 2) is one design out of many pleasing ones, and

FIG. 3.

FIG. 4.

shows how well the polished brass "Arundo" metal lends itself to art-work. The stand fitted with vases in decorated china is all that can be desired. The variety of stands, large and small, and china vases, are well worth inspection, including varieties that find an appropriate place on the table.

Fig. 3 shows a handsome 6-inch Japanese bronzed and engraved gong in "Arundo" art brass-work on an oak board, and fig. 4 a 5-inch hammered gong, the illustration of which speaks for itself. These are only samples out of many prettily designed similar objects. Other articles include tasteful

MECHANICAL VENTILATION.

OF the various appliances employed to produce movement of air in mechanical ventilation, the most convenient and generally adopted are propellers or fans, and the competition that exists

both in practice and tests has proved to be superior to any others before the public, the volume of air delivered by the best being exceeded by about 50 per cent., although the number of revolutions are equal and the energy consumed materially less.

between rival manufacturers as to who shall produce the best appliance at a moderate price cannot but be beneficial to the public at large. We have lately had the opportunity of seeing in work the "Baird-Thompson" propeller, which it is claimed

One of the chief causes of the loss of efficiency with mechanical ventilation, where air-propellers are used, has been that previously volume-fans have not worked to a sufficient pressure to overcome the friction consequent upon long ducts

and change of direction, whereas if a pressure-blower is used it does not deliver a sufficient volume of air to make it suitable for ventilation, and in addition is an extravagant method of utilising energy, the expenditure of power for the results obtained being excessive. The Baird-Thompson propeller is a combination of the two principles designed so as to deliver a greater volume of air than any other propeller. The pressure can be regulated so as to overcome the resistance in any length or form of duct, and that within moderate limits of speed consistent with economical working. That the "Baird-Thompson system of ventilation" and air-propeller is being very generally adopted must be taken as evidence of efficiency at a minimum of cost, it not being necessary to have either such large propellers and ducts or such powerful motors. For driving these propellers any power may be employed, but usually they are belt-driven, either from gas or steam-engine. Special attention may be called to the electric "Baird-Thompson" air-propeller, which is especially suitable either where the electric current is laid on or where electricity is already generated for other purposes, notably where it is necessary to run a fan at a considerable distance from the central source of power, as it is much easier to convey power by electric current in a couple of wires than by steam-pipes or gearing. Another form is the "Baird-Thompson" propeller, a patent high speed engine, combined with which all that is required for driving is a half-inch steam-pipe connected with boiler. The patentees and manufacturers of these propellers are Messrs. Baird, Thompson & Co., 159 Queen Victoria Street, London, and 20-26 Bath Street, Glasgow, from whom all information may be obtained.

SOCIETY OF ENGINEERS.

At the meeting of the Society of Engineers, held at the Town Hall, Westminster, on Monday evening, the 1st inst., Mr. W. A. McIntosh Valon, J.P., president, in the chair, a paper by Mr. Edmund Burrows on Blake's Bridge, Reading, was read. This bridge crosses the river Kennet, and unites the north and south sides of the borough. The old bridge was erected in 1855, with a carriage road only 14 feet wide. Proving too narrow for the increase of traffic, it has been removed, and a new bridge, 30 feet wide, has been erected by the Corporation in its place. The new bridge of 51 feet 4 inches span was designed by Mr. A. T. Walmisley, and consists of lattice girders 4 feet 6 inches deep, having parallel flanges with ornamental

cast-iron work between the diagonal members, so fixed as to provide a parapet without interfering with the definite transmission of strain throughout the braced members of the structure, which is constructed of mild steel. With the view of distributing the live load produced by a steam-roller of 15 tons, together with a distributed weight over the remainder of the platform estimated at 1 cwt. per foot super, trough flooring 5 inches deep is used, having the lines of ridge and furrow fixed at right angles to transverse lattice girders 4 feet 6 inches apart, suspended from the main girders, but stiffened in their attachments at the ends by side brackets. The girder form of construction was adopted as providing uniform headway under the bridge, while the original level of the approaches and roadway over the bridge was not raised. With the view of employing the abutment walls of the old bridge, the new girders were carried on brick piers supported by pile foundations, and surmounted with ornamental masonry caps. The upper flange of each of the main girders is covered with American oak to form a hand-rail. The bridge was tested after completion by loading with water-vans, a 10-ton steam-roller and loaded stone trolleys, in all amounting to a total load of 63½ tons distributed, and gave a deflection in the centre of three-sixteenths of an inch. The bridge was opened for public traffic on October 6, 1892. During construction vehicular traffic was only impeded for about two and a half months. Messrs. Parker & Co. were the contractors for the foundations and masonry, and Messrs. Handyside & Co., of Derby, for the erection of the steel and iron work. The total cost of the bridge and improved approaches was 4,500*l*. The author acted as resident engineer for the Reading Corporation during construction.

CAST-IRON FOR CONSTRUCTIVE PURPOSES.*

THE literature relating to cast-iron is more scanty than that relating to any other of our leading constructional materials, probably because in recent years it has had to give place very much to wrought-iron and steel, and so being of less importance than them, investigations regarding it have not kept pace with those concerning the other forms of iron. Notwithstanding its defects, it still presents certain advantages over other materials,

* A paper read by Mr. F. A. Campbell, C.E., before the Victorian Institute of Architects and published in the *Australasian Builders and Contractors' News*.

which always entitle it to retain a place as a useful, and for some purposes, indispensable material for the architect and engineer, and so while this is the case it is important that our knowledge of it should be as complete as possible. I venture, therefore, to place before you briefly some notes as to the characteristics of this metal, not that I have to lay before you anything new or startling in connection therewith, but by directing your attention to the subject I may be perhaps the means of arousing an interest regarding it in the minds of some members of this Institute, as well as a spirit of inquiry and investigation upon those points which are still obscure.

Cast-iron is a crystalline compound of iron, carbon, silicon, sulphur, manganese, phosphorus, as well as a few other elements in smaller proportions. It is manufactured, as you are aware, from ores which are very widely distributed over the earth's surface, chiefly occurring as oxides or carbonate of iron. These being highly heated in a furnace with fuel and flux are reduced to a molten state, which fluid metal is run from the furnace into channels prepared in a sandy bed, the result being pig-iron, which is the first and crudest description of cast-iron. Pig-iron may roughly be divided into two main classes—white and grey—the first being hard and brittle, the second softer and tougher. The class to which all iron belongs depends not only upon the processes involved in its manufacture, but also upon the amount and kind of elements in combination with it. Carbon is the most important of these, and determines to a great extent not only the various qualities of cast-iron, but also whether the combination is cast-iron, wrought-iron or steel. The proportion of carbon in these is—Cast-iron, 2 to 6 per cent.; steel, 1.5 to 1.8 per cent.; wrought-iron, trace to .25 per cent. It is evident then that the greater the proportion of carbon the greater becomes the hardness and brittleness of the metal, the white cast-iron being the most highly carbonised of the whole series. The manner, however, in which the carbon occurs in the metal influences it as well. In all cast-iron it occurs in two forms, chemically combined and mechanically mixed; when chemically combined the white iron is the result, when mixed in the form of graphite the grey iron, and the softer grey may be turned into the brittle white by heating and suddenly cooling it, which process apparently prevents the carbon in the molten metal from separating in the form of graphite, and so it becomes combined with it. Of the other elements found in combination with iron, I will only mention phosphorus, which renders the iron weaker, but more fluid and suitable for small and delicate castings; and

manganese, which forms a metal much used in steel manufacture.

Cast-iron in forms ready for constructional purposes is prepared from the pig-iron by a further process of smelting which renders it more homogeneous, assists to free it from impurities and is necessary in order that it may be run into the moulds to give it the form required. The founder prepares the metal according to the work it has to perform, choosing and blending various qualities of pig according to the dictates of experience. The grey pigs are those chiefly used in the foundry, the white being more useful for the manufacture of wrought-iron. Toughened cast-iron is made by adding a certain proportion of scrap to the mixture in the furnace. Malleable cast-iron is made by absorbing some of the carbon from the cast-iron, and this is done by heating it in combination with powdered hematite; so far as it is affected it becomes a material approaching wrought-iron. The cost of the process and the limited extent to which the casting is affected militates against the extensive use of this material.

Chilled castings are made by suddenly cooling parts of a casting, and so rendering them hard and durable, such as the tyres of railway wheels, this being done by placing iron blocks in the mould, by coming into contact with which the rapid cooling is effected. The nature of the change is the same as that mentioned in connection with turning grey into white pig-iron. Leaving aside all these more uncommon forms of cast-iron, we find the ordinary metal as supplied by the founder as a building material is hard and brittle, not weldable nor malleable, weak in tension and imperfectly elastic, yet it is strong in compression, can be melted and moulded with very considerable accuracy, can be wrought with steel tools, if cared for will last for an indefinite length of time, is fireproof, and compared with other forms of iron is cheap.

I will next direct your attention to the behaviour of this material under stress.

Remelting increases the tensile strength, but also the cost of material. Keeping the metal for some time in a state of fusion increases the tensile strength, and, as it cannot add greatly to the cost, further investigation in this direction would be of interest. One set of experiments shows that the metal kept half an hour in fusion gave a strength of 7 tons per square inch, and for hours a strength of 16 tons. Cast-iron has a tensile strength ranging from 4 to 11 tons, the average adopted usually being 7 tons. Malleable cast-iron will give results up to 25 tons, and some American irons up to 20 tons per square inch.

CONCOURS NATIONAL, PARIS.
SOUTH AFRICAN EXHIBITION, KIMBERLEY.
NOVEMBER 1892.

Compression (*i.e.* under a direct crushing stress without flexure).—Cast-iron varies from 35 to 55 tons per square inch, the average being 45 tons, malleable going as high as 70 tons, the ratio of compressive to tensile strength being as $6\frac{1}{2}$ is to 1.

Under a shearing stress, cast-iron is about three-fourths as strong as wrought-iron, varying from 12 to 18 tons per square inch, the average being 15 tons.

Flexure, *i.e.* the complicated stress endured when it acts as a long column.—For information on the subject of columns generally, I must refer you to Hodgkinson's experiments and Box's practical treatment of it in his work on the strength of materials. It may be mentioned, however, in general terms and with certain modifications, that the strength of a column varies according to the strength of the material of which it is composed, directly as the fourth power of its diameter and inversely as the square of its length. The first factor is obtained, of course, from experiment, and while cast-iron is much stronger as a short column than wrought-iron, when the length is twenty-four times the diameter they are equal, and beyond that wrought-iron becomes the stronger.

Under stress as a beam, cast-iron as far as strength is concerned does not compare unfavourably with wrought-iron, being as 17 is to 22; it has, however, a fatal defect in this capacity, viz. its want of elasticity. It is now little used as a beam, although in the comparatively few cases which occur of a constant dead load to be carried, there is no reason why with proper precautions it should not answer very well. Mod. of rupture varies from 15 to 50 tons.

Impact, or the sudden application of a load, concerns both beams and columns. The laws relating to impact and to resilience, which is the power to resist impact, are rather remarkable, but are derived from experiments upon beams. Experiments upon loaded columns exposed to lateral shocks have not, so far as I know, been made, and as a loaded column will not be affected in the same way as a loaded beam under impact, further investigation in this direction is necessary. The chief points to be noted regarding this subject are as follows:—A load placed on a beam and released suddenly causes twice the deflection caused by a dead load of the same weight. The resilience of a beam varies directly as the depth, the breadth and the length of the beam, and, therefore, as its weight between the points of support. It is the same whether the load be applied at the centre or any other part of the beam. It varies as the square of the deflection. It is increased by the presence of a dead load up to a certain point. From these

laws it will be at once evident that other things being equal, a stiff inelastic beam or column is less able to resist a shock than a long and unyielding one, and that cast-iron as a material is eminently weak in powers of resilience.

It is found that most materials under stress exhibit a strain or alteration of form which up to a certain point is fairly proportionate to the stress it endures, either in tension, compression, or as a beam, but beyond this point that the deformation increases in a greater ratio than the load. This point is termed the limit of elasticity, which it is of considerable importance to be able to determine. In the case of wrought-iron and steel, whose elasticity is tolerably perfect, this point is well defined, but with cast-iron it is not the case. To make the matter clearer, I will submit a typical stress diagram of each. [The lecturer here illustrated the point by diagrams drawn on the blackboard.] Thurston, an American writer on materials, says that the elastic limit is more important than the ultimate strength for general purposes, and that the diagram of deflection of cast-iron being a parabolic curve, he has been accustomed to assume that the elastic limit may be taken at a point at which a tangent to the curve makes an angle of 45 deg. with the axis. How he arrives at that conclusion it is difficult to say. A glance at the diagram is sufficient to show that there can be no defined elastic limit, and therefore it must be left out of the question in connection with the strength of cast-iron.

Permanent set is that deformation which takes place in material under stress, which remains even after the load has been removed. With cast-iron the diagram shows that it commences apparently as soon as the pressure commences, and increases like the deflection in a higher ratio than the loads, the diagram also forming a parabolic curve, so that this affords no assistance in determining the elastic limit.

It has been ascertained very clearly that, as the size of a casting increases the proportionate strength diminishes. This will be seen from the following series of experiments upon different sizes treated as beams:—

Inches square	$\frac{1}{2}$	1	1 $\frac{1}{2}$	2	2 $\frac{1}{2}$	3
	1'35	1	1'90	1'84	1'78	1'74
					2'67	2'62

the second row of figures giving the ratio of strength, as compared with that of a bar 1 inch square, which is taken as the unit.

The form of the design affects the strength very considerably.

ably. When a casting cools, the crystals arrange themselves at right angles to the surfaces, so that in a thin flat plate there would appear two diagonal lines connecting the corners where the angles of the crystals change. These form lines of weakness, so that with a flat-ended cylinder lines of weakness would also occur at the corners. It is, therefore, advisable to avoid as far as possible angles and corners of all sorts. In a round-ended cylinder, for example, no such lines of weakness occur. It is also of great importance to avoid any sudden change of size in a casting; where it is necessary that the size should vary in the different parts, the changes should be gradual and projections and angles avoided as far as possible. To pour large castings so that there shall not exist an internal stress is a difficult part of the founder's art, and is effected by removing the sand first from the thicker parts which otherwise would cool more slowly than the rest.

The strength of any material depends amongst other things upon the way in which the load is applied. If a constant dead load be represented in its effects upon a beam by 1, then it has been found by experiment that if the same load be moved off and on, its effect may be represented by 2, and if accompanied by a shock will be increased to 4. And, further, that if the load be applied first in one direction and then in the other, its effect would be equivalent to 4 and 8 according as it was applied without or with a shock.

To find factors of safety is one of the most difficult problems in connection with material of construction. Rivington gives the following table for cast-iron:—

Girders	Board of Trade—Dead load	3'6
Pillars	Stoney	6
Watertanks	"	6
Crane posts	"	4
Pillars with vibration	Live load	8
" " impact	"	8
" " impact	"	10

The difference between the Board of Trade and Stoney's factor for girders is noticeable. Thurston recommends as a minimum:—

Dead loads.	Live loads.	Dynamic.
4	7	10 to 15

Box has for—

Dead loads.	Intermittent.
3	One direction.
	Without shock.
	With shock.
	9
	18

The following require consideration in fixing the factor of safety for cast-iron:—Defects in the material, inequality in

distribution of stress, manner in which the load is applied position and importance of the structure, if a column whether exposed or not to lateral shocks. I am of opinion that the factors of safety suggested by Box are not too great, if the failure of the structure would involve loss of life and if the conditions of loading and of impact were unfavourable. The behaviour of cast-iron under fire is a matter of considerable importance to the architect. In Berlin instructions were issued by the Police Department that unprotected cast-iron columns were not to be used, but were to be superseded by wrought-iron columns, cast-iron columns surrounded by wrought-iron with air space between, or stone set in cement. Herr Bausenger, in consequence of this curious edict, carried out a series of experiments upon various materials in fire, suddenly cooling them with water. He found that cast-iron stood the test best, wrought-iron collapsing, and that out of granite, limestone, sandstone, concrete and brick, concrete was the best. After this probably the Police Department retired from their position.

The principal tests now employed are those for strength in a testing machine, and, on account of the facility offered, they are usually tested as beams of a size 1 inch by 1 inch, by 3 feet, or 2 inches by 1 inch, by 3 feet. Specifications for cast-iron usually require a strength of from 670 to 780 lbs. for the first, and from 25 to 30 cwt. for the second. Professor Kernot suggests 750 lbs. for the first, and points out correctly that four times that cannot be expected from the larger specimen. He considers 22 cwt. ample for the purpose, with a deflection of not less than $\frac{1}{8}$ inch for the small bar and 5-16 inch for the large one. I will conclude this paper with a few remarks upon cast-iron as a suitable vehicle for ornament.

In the eyes of Ruskin cast-iron is a barbarity and quite beyond artistic treatment. However, all are not, fortunately, of this opinion, there being many who consider that cast-iron, vulgar as it frequently appears, has a quiet beauty of its own, provided it is treated in the right way. It cannot, of course, rank with bronze, for the rust of iron has nothing to command it artistically, so that it must rely chiefly upon the form of its design for its claim to be admired; nothing in its outside adornment should distract the attention from its outlines or decorative treatment, nor should it impose upon the public by attempting to disguise the nature of the material such as painting it to resemble bronze or granite. And as the outside colouring should be quiet and dull, proclaiming as far as possible that the material is cast-iron and nothing else, so with the form and decorative treatment, all should be in keeping with

the nature of the material designed from the fullest knowledge of its manufacturing, its weakness and its strength. I will conclude by quoting Mr. W. R. Lethaby upon this point. He writes:—"1. The metal must be both good and carefully manipulated; 2. The design must be thought out through the material and its traditional methods. 3. The pattern must have the ornament modelled, not carved, as is almost universally the case now, carving in wood being entirely unfit to give the soft suggestive relief required both by the nature of the sand-mould into which it is impressed and the crystalline structure of the metal when cast. 4. Flat surfaces, like grate-fronts, may be decorated with some intricacy if the relief is delicate. But the relief must be less than the basis of attachment, so that the moulding may be easily practicable, and no portions invite one to test how easily they may be detached. 5. Objects in the round must have a simple and substantial bounding form with but little ornament, and that only suggested. This applies equally to figures. In them homogeneous structure is of the first importance."

THE BISHOP'S PALACE, WAKEFIELD.

At a recent meeting of the Works Committee of the Wakefield Town Council some correspondence was read relative to the occupation of the Bishop's Palace without a certificate being obtained as to its fitness for human habitation. A letter addressed to the chairman of the committee from Mr. William White, London, architect for the Bishop's Palace, stated that he had inspected the premises, and offered explanations with respect to the work which had not been carried out in accordance with the plans approved by the committee, and he asked that the Bishop might be allowed to enter into immediate occupation pending certain alterations being carried out with respect to the sanitary arrangements. The Bishop of Wakefield also wrote asking that the necessary certificate for the occupation of the house might be granted without the structural alterations being insisted upon.

It was proposed that the city surveyor should be instructed to withhold his certificate under section 60 of the Wakefield Improvement Act, 1877, until the building was made in conformity with the plans as approved. It was moved as an amendment that the question of the city surveyor issuing his certificate be referred to the Council for consideration. The

amendment was put to the meeting and declared to be affirmed, and was then put as the amended proposition and declared to be carried.

At the meeting of the Council, on its being proposed that the minutes of the General Works Committee be confirmed,

Alderman Carter moved, "That no certificate be granted for the occupation of the Bishop's Palace until the drainage and sanitary arrangements are completed and the building regulations now in force properly carried out." He pointed out that when the plans for the Palace were placed before the General Works Committee several members remarked as to the lowness of the rooms, but having no power to order them to be made higher, the plans were allowed to pass. When the building was completed it was stated there were rooms lower than the dimensions specified on the plans. The servants' hall was 7 feet 9 inches from floor to ceiling, and there were other rooms the same height. He found that the lodge at the entrance-gates was also 7 feet 9 inches, and even if the Palace was allowed to pass, he thought something should certainly be done in regard to the lodge. In the by-laws under which the Corporation had been working for many years, it was stated that the height of every habitable room should be 8 feet at least. Then on page 8 of the epitome of the Improvement Act, 1877, it was pointed out that no new building could be occupied as a dwelling-house until the drainage was completed, and until the same had been certified in writing by some officer of the Corporation to be fit for habitation, the penalty being 5*l.*, and the continuing penalty 40*s.* for each day. On March 27 he moved that the matter be referred to the Council for decision, believing that, as difficulties were likely to arise, and that it was rather too much to take a quiet vote in a hole-and-corner manner, it would be better to have a full expression of opinion. He did so all the more readily because for some time past the Corporation had been trying to do work under that Act of Parliament by compelling builders of houses who did not comply with the by-laws to alter them, and he thought it would not do to have one law for the rich and another for the poor. No one in that room wished to perform better services for the Bishop than himself, but the ratepayers and the local architects expected them to do their duty, whether it was to a king or a peasant. On Wednesday, April 5, the General Purposes Committee was called together at five o'clock, and the meeting took place at 7.30. Sixteen members turned up. He had no doubt the meeting was called with the best intentions, as the Bishop was placed in a very peculiar position. When

SPECIALTIES:

GROOMBRIDGE'S Patent SELF-ADJUSTING BRACKET,

For Seats, Shelves, Tables, &c. Specially adapted for use in Churches, Chapels, Schools, Theatres, Public Buildings, Trams, Railway Carriages, Steamships, Yachts, &c.

LIST OF PRICES.

Each.

	8"	10 1/2"	12"	14"	16"
Iron	6/6	7/6	8/6	9/6	10/-
Brass	10/-	12/-	14/-	16/-	18/-

The Advantages of this Patent Bracket are that it can be raised or lowered by the action of only one hand. It is automatic and perfect in action, and the extreme simplicity of its arrangement prevents any possibility of its getting out of order.

PRESTON'S Patent SCREW ADJUSTMENT,

For opening, closing, and securely fastening Fanlights, Casements, Skylights, &c.

A749, 1/4-inch Rod x 18 inch.	each.
All Brass	11 <i>s.</i> 6 <i>d.</i>
Brass Wheel, Iron Fittings	10 <i>s.</i>
A866, 3/8-inch Rod x 12 inch.	each.
All Brass	8 <i>s.</i>
Brass Wheel, Iron Fittings	7 <i>s.</i> 6 <i>d.</i>

This thoroughly efficient Screw Adjustment provides for opening, closing, and securely fastening Fanlights, Casements, &c., and will by its extreme simplicity commend itself to Architects, Builders, &c.

Working Models of the above and other Specialties may be seen at our new Show-rooms, 57 HOLBORN VIADUCT, E.C. Architects and Builders are invited to inspect same.

the Town Clerk at that meeting told them that by-law 15, under which the Corporation had been working for years, was bad, he was amazed. He hoped, therefore, every despatch would be used to get new by-laws, and that the Corporation would no longer be placed in such a predicament. Of course the erection of the Palace had been carried out under the supervision of London architects, with foreign builders and their own clerk of the works. For his part he believed that Wakefield architects would have done the work better. If he were the Bishop he would be under no obligation to the Council, but would alter the height of the rooms himself and for ever remove the stigma of the Palace being pointed out as a precedent. His resolution would place the Bishop in a most difficult position, but as members of the Corporation they had frequently unpleasant duties to perform, and so long as he was a member of the Corporation he should try to perform his duty in seeing that all the laws were properly carried out.

Mr. Harrison seconded.

Mr. Bolton: I should like to ask if it is a fact that the certificate has been granted.

The Mayor: No; permission has been given to occupy the place. That is all.

Mr. H. Smith: Can we override the resolution passed by the General Purposes Committee? I apprehend that committee has the same powers that we have in this Council to-night. My contention is that Alderman Carter is entirely out of order. The General Works Committee minutes have already been passed.

The Town Clerk read the minute passed at a meeting of the General Purposes Committee on April 5 as follows:—"That it be recommended to the Council that the Bishop of Wakefield be permitted to occupy his residence in Westfield Road upon an undertaking being given that the windows should be altered in accordance with the provisions of the Wakefield Improvement Act, 1877, and the sanitary arrangements carried out as suggested in the letter of Mr. White on the 11th ult. and to the satisfaction of the city surveyor."

Mr. Yates asked if it was not very unusual to call a special meeting of the General Purposes Committee to pass either plans or anything else in connection with the erection of residences? That fact itself denoted there was one law for the rich and another for the poor.

Alderman MacGirr said that the meeting of the General Purposes Committee was called in the first instance at his request, with the sanction of two or three of the members, and

they acted perfectly within their right. While admiring the consistency of Alderman Carter, and the boldness with which he had taken the subject up, he must state that, having looked at the question with an impartial eye and without preference on either side, he had partly abandoned the official rule which should govern them in that case, and voted in favour of the recommendation of the General Purposes Committee. He had heard the Bishop's residence called both a palace and a penitentiary, and it was certainly more like the latter than anything palatial. It did not say much for those who were called foreigners; nobody in Wakefield seemed to have had anything to do with it. He very much regretted that the work was not placed in the hands of some local and competent architect, for it would have been much easier to have approached him, and the members of the Corporation would have taken greater interest in the progress of the buildings. He had explained the reason that induced him to vote for the relaxation of the principle which he, along with others, had strenuously advocated in the past. In the first place, some misunderstanding appeared to have taken place in regard to the construction of the by-laws; that was to say, the London architect informed them the rooms were 8 feet 9 inches from floor to floor. It appeared to be necessary for bishops and gentlemen who required abstruse study and reflection that all the rooms should be noiseless, consequently some of these had been padded and otherwise encumbered with substances that had broken the noise of those who might be walking about, but had interfered with the contour of the rooms and the height of the ceiling. But the fact that there was a large amount of space around the building and plenty of ventilation, induced him to relax his opposition. Then the Town Clerk told them the other night that the by-laws were not worth the paper on which they were printed. The Corporation had absolutely no power to compel any alteration of the rooms, and were utterly unable to vindicate the integrity of their by-laws. If the rooms were only 6 feet 9 inches the Corporation were powerless in the matter, and his idea was that the members should get the by-laws amended as quickly as possible. Let the Corporation therefore gracefully retire from an opposition they were unable to maintain.

The Mayor said he could testify to the fact that the Town Clerk had held the same opinion, that the by-laws did not apply in a case of that kind, ever since he entered the service of the Corporation. There were exceptional circumstances surrounding the Palace which enabled them to withdraw their opposition without constituting a precedent for future cases.

The Palace could never be closely surrounded by buildings, so that there would always be plenty of air space, and it was much better to have the rooms 7 feet 9 inches with plenty of ventilation than 8 feet without ventilation.

Alderman Carter said it was a deplorable thing to allow what ought to be one of the finest buildings in the town to have rooms only 7 feet 9 inches in height.

The resolution was put to the meeting and declared lost by seventeen votes to five.

Mr. Harrison observed that not a word had been mentioned about the cottage near the gates. He did not complain so much about the Palace as about that, and did not think the committee would pass plans for another such cottage in Wakefield.

Alderman MacGirr said the statement of Mr. Harrison was a mere quibble, for the lodge was part and parcel of the undertaking. He was right in calling attention to it, but he should certainly not dissociate one from the other. At the same time, it should be a moral obligation upon the promoters to make the lodge as habitable as any other cottage house in the city.

Mr. Brown remarked that the lodge was not really habitable; it was more like a place for keeping canaries in. It was never intended for two persons to live there day and night, in fact, it was impossible for them to do so to be healthy. He moved that the lodge be not occupied until it was altered in accordance with the existing by-laws.

Alderman Carter seconded.

Alderman MacGirr: I have just heard such an account of this dog-hole of a lodge, which is not fit for habitation, that I am going to support the resolution. I am told it is utterly incompatible with the decent comfort of a man and his wife.

Mr. G. A. Moorhouse: Is the lodge carried out in accordance with the plans?

The Town Clerk: I am not aware of it.

Alderman MacGirr added that the Corporation had helped the promoters very handsomely out of the difficulty in regard to the Palace, and surely they ought to remedy the matter as to the cottage in some way.

The Mayor expressed his surprise that a member should one minute say "it was a mere quibble," and then turn round and remark that the lodge ought to be considered separately.

Alderman Rhodes said that as the plans for both places had passed the committee he did not see how the Corporation could debar the gate-keepers from occupying the lodge. No one had ever pointed out until that night that the lodge was

unfit for habitation. He did not know how they would look in the papers, to find that in the first instance permission was given for the plans to pass and then at the finish the Corporation objected to the lodge being occupied.

Mr. G. A. Moorhouse observed he had been as strenuous in his adherence to the by-laws as anyone, but he should never try to enforce a law which did not exist. It would be a great inconvenience and entail considerable expense if the promoters of the Palace were required to alter the lodge.

It was decided that no action be taken in regard to the lodge.

PATENTS.

[This List of Patents is compiled specially for this Journal by Mr. G. H. Rayner, of the firm of Rayner & Co., Consulting Patent Agents, 37 Chancery Lane, London, W.C., from whom all particulars and information relating to Patents may be had gratuitously.]

APPLICATIONS FOR PATENTS.

7765. John Whitehead, for "An improved automatic door-fastener."

7813. Arthur Lowe, for "The combined cross-grooving and stop-grooving plane."

7868. John Abraham Noel, for "Improvements in gully and trap-heads, and in grids therefor."

7930. John Horace O'Brien, for "An improved lock-nut and bolt."

7988. William Murison, for "Automatically fixing (setting open) in two or more positions any lid-flap, sash-hatch, &c. viz. improved pivot-hinge."

8014. George Breeze, for "An improved sash-fastener."

8021. Melvin Albert Panly, for "An improved fire-escape."

8031. James Gerrans, for "Improvements in the construction of cistern valves."

8098. Martin Higgins, for "Improvements in locks."

8107. Arthur Warner, for "Improvements in mutation lever locks."

THE BLACKMAN VENTILATING CO., LD.,

Having acquired an extensive and special experience in handling many thousands of successful Installations for Mechanical Ventilation, invite correspondence from Committees, Architects, Builders, and others who are practically interested, and will be glad to forward printed matter to any address, and to submit Schemes and Estimates for

WARMING AND VENTILATING

any proposed or existing building.
All difficulty in the employment or transmission of power to any part of a Building, wherever Electric Current is available for driving, can be avoided by using the

ELECTRIC BLACKMAN,

Or BLACKMAN FAN and ELECTRIC MOTOR combined (Watel's Patent).

Besides this it facilitates distribution of effect, and is extremely economical in working.

Office:—63 FORE STREET, LONDON, E.C. Branches at MANCHESTER, BRADFORD, BRISTOL and GLASGOW.

THE ELECTRIC BLACKMAN.

TRADE MARK

THE IMPERIAL INSTITUTE.*

THE JOHANNESBURG EXCHANGE.

THE IMPERIAL INSTITUTE.

THIS building was formally opened by Her Majesty the Queen on Wednesday. It is a matter of history now that the building was intended as a jubilee memorial. It may, however, be of interest to refer briefly to the work in selecting the site and arranging for a building worthy of the occasion.

One of the earliest questions with which the organising committee had to deal was that of the selection of a suitable site. It was urged by many prominent subscribers that the Institute should be built in a central position within the area of the City of London, if possible. But the committee had to keep in mind the all-important matter of cost. Inquiries showed that there was no possibility of acquiring an adequate area of ground, either in the east or west central districts, for any sum of money falling within the limits of the funds likely to be received. Several sites were proffered, but in no case did the price asked fall short of a quarter of a million, and, even had the committee been able to give such a sum, the area provided did not at all approach the requirements of the Institute. The committee consequently had to give up the idea of obtaining a central site, and directed their attention to the property at South Kensington held in trust by the Commissioners of the Exhibition of 1851. It was represented to that body that the Imperial Institute might reasonably advance a claim for the grant of a site of sufficient magnitude for its purposes from the land purchased with the surplus proceeds of the first International Exhibition. The appeal met with a prompt response. The Commissioners offered an extensive site, at a nominal rent, under certain conditions which were accepted.

As soon as the lease of the site had been formally passed the committee invited architectural plans. Several well known architects sent in designs, and ultimately the judges, the late Earl of Carnarvon, Lord Herschell, Sir Frederick Leighton, Sir Frederick Abel and Mr. Waterhouse, decided to accept the plans prepared by Mr. Thomas E. Colcutt, "being of opinion

* This illustration is from a special photograph by Messrs. Bedford Lemere & Co.

that these, if thoroughly carried out, would provide a monumental structure worthy to commemorate the occasion of the Institute's foundation, as well as adequate accommodation for the various functions to be fulfilled by the building, and at a cost falling within the warranted limits of expenditure." According to Mr. Colcutt's description, "the prevailing style of the building is a free rendering of the Renaissance, and, as the amplitude of mouldings and the abundance of arabesque carvings show a decided relationship to early Italian Renaissance, it may be said that the Imperial Institute affords a characteristic example of the gradual movement towards the Renaissance, as practised in this country during the last two decades." The crowning attraction of the foreground, Mr. Colcutt adds, is the great portal surmounted by the large square tower, and capped by a dome-shaped cupola. The altitude of the tower is nearly three hundred feet, the two flanking towers being 176 feet high. Their solidity is insured by walls 9 feet thick, composed of hard bricks set in cement. Within these towers are contained tank-spaces and store-rooms, and the upper chamber of the central beacon contains a complete peal of bells, ten in number, designated, by permission of the Princess of Wales, the "Alexandra" peal. The tenor is two tons in weight, and bears the following inscription:—"Victoria R.I., 1837-1887." The other bells are named after the Prince and Princess of Wales, the Duke of Edinburgh, the Duke of Connaught, and the five children of the Prince and Princess of Wales, the total weight of the ten bells being over eight tons. As placed, the peal is the highest in the country, as the bells swing in a chamber 200 feet above the level of the ground floor of the main building. The gift was a personal one to the Prince of Wales by Mrs. E. M. Millar, of Melbourne. The only condition specified by the donor was that the bells should be rung on the birthday and accession-day of the Sovereign and the birthdays of the Prince and Princess of Wales. Mrs. Millar's wishes were carefully observed on Wednesday, for one of the items in the day's programme was the ringing of the peal at intervals during the day, and especially when Her Majesty arrived and departed.

Portland stone is used in facing the front walls, and the use of red brick enters sparingly into this portion of the work, being chiefly confined to the recesses, where it is of service in sensibly adding to the desired variations in light and shade. The principal entrance, which in itself gives character to the whole buildings, has imposing dimensions, being 17 feet wide, nearly 24 feet high, and constructed entirely of Portland stone.

B. E. NIGHTINGALE, Builder & Contractor,
ALBERT WORKS, ALBERT EMBANKMENT, LONDON, S.E.

The frieze over the arch will ultimately be covered with symbolic modellings, including a central seated figure of the Queen. The distinctive feature of the building will be the great hall, the site of which is now occupied by a temporary structure, fitted up for special use on Wednesday. Its dimensions are to be 128 feet long and 60 feet wide, the side aisles being 12 feet in width. A beautiful stairway, supported by pilasters and adorned with a wealth of multi-coloured marbles, leads to the first floor, and so the visitor may pass on to the library, the conference hall, the laboratories, the museums, and to all the conveniences which it is the object of the Imperial Institute to supply. As an example of the interest which is taken by our fellow-subjects in India, it may be noted that the eastern colonnade connecting the main building with the Indian Section has been erected at the expense of Mr. M. M. Bhownaggee, C.I.E., as a memorial of his sister. The whole structure, with the exception of the fittings, consists of fireproof materials, and care has been taken to secure every fireproof appliance. The building is illuminated throughout by the electric light, and will be heated in the winter on the most approved principles. The quadrangles at the rear—prosaic as they now seem, but by-and-by to be adorned with a wealth of flowers—form the oblong arcades, the central and north galleries, and the temporary great hall. The east end of the north-west quadrangle, which adjoins the East Indian court, is occupied by the Indian pavilion, which will make a very attractive winter garden. Finally, we may say that the total outlay upon the buildings and their appurtenances as they now exist or are in course of completion stands at 280,000*l.* An addition of 80,000*l.* to the building fund will be required before the great hall, the library and the conference hall can be completed.

Last Saturday it seemed as if weeks would be required to place the building in proper order, but in a few days an army of workmen effected an entire change. The scaffolding in the vestibule has been taken down, the marble decorations make their full effect; we can now see the wealth of carving and design which has been lavished on the interior. Both inside and outside, what decorative art could do to add to the magnificence of the ceremonial was done.

One of the most distinctive and interesting features of the arrangements was the boudoir which was prepared for the use of the Queen and the royal family by Mr. T. G. Litchfield. The pavilion, tented with figured silks, stood in the main east corridor, and was furnished in the most luxurious manner. Curious old Chinese pictures on glass were the distinctive

features of the scheme of decoration. The furniture of the boudoir is of the Louis XV. period, covered with delicately-figured tapestry, with which also the sides are adorned. These were by no means the only preparations made to meet Her Majesty's convenience and comfort. But passing over a mass of minor details we may speak especially of the arrangements made for the sovereign's reception in the great temporary hall. The canopy which was used to overhang the chair of state was an interesting object, gorgeous in purple velvet, and adorned with the rose, the thistle and the shamrock in emblazoned gold. But still more interesting was the throne used by the sovereign. This remarkable trophy was made for Runjeet Singh, and came into our possession after the war which led to the downfall of that potentate. It is one of the most attractive items in the collection of native Indian regalia exhibited in the Indian section of the South Kensington Museum. Nearly a hundred years have passed since the throne was made for the Lion of the Punjab, in 1799, and it still stands as a memento of Oriental magnificence and pomp. The design is octagonal, and the gorgeous fabric rests upon eight feet. The whole of the throne is covered with chased gold plates mounted on wood, and embellished with ornaments of a bold floral and foliated character. Three cushions of yellow and red velvet complete the upholstery of this imperial seat of state, and there is a further adornment in the shape of peacocks' feathers, in gold filigree holders, which are the emblems of Indian royalty.

The lifting machinery, designed and erected by Messrs. Archibald Smith & Stevens, consists of eleven hydraulic lifts with pumping engines and power storage plant. There are two handsome passenger lifts running from the ground to second floors, three lifts for reception and distribution of coals and general stores, three appropriated to the kitchen department, one for delivery of refuse from the engine and boiler-house, one heavy machine capable of raising a ton up to the central shaft of the east tower, and designed for dealing with stores and large objects for the museum, and finally a three-ton lift for raising extra large exhibits to the upper floor of the great gallery running east and west. All these are supplied by water at 700 lbs. pressure per square inch, *i.e.* equal to the pressure which would be given by a tank placed 1,600 feet high. This water is pumped by an engine into a weighted receiver or accumulator, wherein it is stored at the required pressure, and drawn off as required by any of the lifts. Immediately this occurs the accumulator, by automatic mechanism, starts the pumps, which run till the accumulator is again full, when it

JAMES HILL & CO., 100^A Queen Victoria St., London, E.C.

automatically stops them till more water is required. All the water employed is returned by the lifts to the pumping machinery for re-use, and is therefore not wasted but kept constantly circulating. The cost of working the system is consequently only that of the coal burnt and the labour of stoking, no other attendance being required. In its outlines the system is similar to that adopted by the London and other hydraulic power supply companies, and to that on which the lifts for the Electric Railway are worked.

The electrical apparatus whereby electrical communication was made with the belfry to start the peal of bells was designed and erected by Messrs. Julius Sax & Co., Limited, under the personal supervision of Mr. Alfred Slatter, their manager, as well as the electric lighting of the Queen's lift, and complete telephonic and bell communication throughout the building.

The New Wire Wove Roofing Co., Limited, of 75A Queen Victoria Street, E.C., have covered the entire roof of the Grand Hall and the Prince of Wales's smoking pavilion with their well-known carboline and duroline, and it is certainly a tribute to the excellence of these unbreakable glazing materials that they have been specified for such important work. We hope it is a prelude to their general adoption for roofing purposes.

The following firms have carried out the principal contracts in connection with the Imperial Institute:—Sanitation, Mr. George Jennings; ventilating and heating, Messrs. Clements, Jeakes & Co.; electric lighting, Messrs. Allpress & Bellshaw; electric light fittings, Messrs. Thos. Potter & Co. and Richardson, Ellison & Co.; ironwork for the pavilion, &c., Messrs. H. Young & Co.; furniture and decoration, Messrs. Maple & Co., Collinson & Lock, Gregory & Co. and Webb & Gibbons; overmantels, grates, &c., Mr. J. Elsley; ceiling decorations, &c., Messrs. Collinson & Lock and Messrs. Jackson & Sons; mosaic work, Messrs. Burke & Co., Rusts Limited and De Grelle Hondret & Co.; lifts, Messrs. Smith & Stevens; stained-glass, Mr. Clement Heaton; wood-block flooring, The Acme Wood Block-Flooring Co., Limited.

GOLD AND JEWELLED KEY FOR THE IMPERIAL INSTITUTE.

THE manufacture of the gold and jewelled key which was presented to Her Majesty the Queen for use at the opening ceremony has just been completed by Messrs. Chubb & Sons, Limited, of Queen Victoria Street, E.C. The use of this key by Her Majesty during the ceremony symbolised the inauguration of the Imperial Institute.

His Royal Highness the Prince of Wales has himself given personal attention to the designs, which have been carried out under the direction of Sir George Chubb.

The key has been made to withdraw the bolt of a lock fixed in the block upon which a model of the Imperial Institute stands, close to the Queen. Upon the insertion and turning of this key by Her Majesty the bolt fell and automatically completed an electric circuit to the belfry, when the great peal of bells in the tower for the first time rang. The wards of the key form the letters "I. I.," the initials of the Imperial Institute. The gold and diamonds of which the key is composed have been contributed by several Colonial Governments and by India, so that different portions of the British Empire are represented by its various component parts. The head of the key is formed of gold from South Africa; the silver in the star ornaments comes from the Broken Hill Mine, Australia; the stem is formed of gold from British Columbia, while the bitt and wards are composed of the precious metal from Queensland mines. The stem of the key is encircled by a riband in red gold and a wreath of laurel leaves in green gold, both obtained from Victoria, while gold from that colony composes the ornaments upon the lid of the case containing the key. The diamonds in the key and ornaments are from South Africa, the rubies from Burmah and the pearls from Ceylon.

The design of the head is circular, with the royal and imperial crown on the summit, and the Maltese cross with fleur-de-lis of the royal coronet forming the outer border. This joins the stem of the key by descending curves, decorated with shields and the enamelled national symbols—rose, thistle and shamrock. The obverse shield bears the arms of the United Kingdom, the reverse those of England alone. The chief features of the head are the Grand Stars of the Indian and Colonial Orders given in exact facsimile on a slightly reduced scale. The Star of India has a fine diamond star of five points in the centre upon a delicate blue ribbon arranged as a garter, with the motto, "Heaven's light our guide." From this proceeds a circle of flaming rays in burnished gold, which occupies the entire inner circle of the key head. On the other side is the Star of a Knight Grand Cross of the Order of St. Michael and St. George. The centre is enamelled, and encircling it is the motto, "Auspiciis melioris ævi," whilst the cross of St. George in red enamel and rays of faceted silver and gold complete the design. The stem of the key is richly diversified

with mouldings, the inscription on the gold ribbon being, "Imperial Institute: commenced 1887, inaugurated 1893." The wards of the key are decorated in keeping with the style, and on the rim of the key head is the leading inscription, "Presented to Victoria, Queen-Empress, on the occasion of the opening of the Imperial Institute, May 10, 1893."

The case of the key is of royal blue velvet, lined a paler blue, and has on the lid an ornament of the royal and imperial crown set with diamonds, rubies and pearls, and beneath it the orb set with fine stones of pure colour. The royal sceptre and the sceptre of peace are placed behind it, with a laurel wreath encircling all. A gold shield surmounted by a crown inside the case bears an inscription describing the sources from which the gems and precious materials of which the key is made have been obtained.

LONDON CHAMBER OF ARBITRATION.

THE Corporation, on the suggestion of the Joint Committee of Management of the London Chamber of Arbitration, have made certain additions and alterations of considerable practical importance to the rules and regulations of the Chamber. A model clause for insertion in trade contracts, providing for the submission of disputes arising in connection with such contracts to the Chamber, having been settled by counsel and approved by the joint committee, a new rule had been framed dealing with arbitrations referred to the Chamber under such clause. A new rule was also found necessary for dealing with references to the Chamber from the High Court. Both these rules had been settled by counsel under the instructions of Mr. H. H. Crawford, the city solicitor. In addition, certain alterations of existing rules were recommended by the committee in regard to counsel's and arbitrator's fees. According to the rules, the fees to counsel and solicitors were to be on the same scale as those allowed in the High Court, "but for attendance at the hearing only." This last proviso has now been omitted. It has also been settled that the time occupied by an arbitrator in drawing up his award, which is not infrequently longer than the actual hearing, should be considered as a continuation of the hearing, and words to this effect have been added to the scale of fees for arbitrators and umpires.

VARIETIES.

THE Brownhills Local Board recently selected four engineers to submit schemes of sewerage and sewage-disposal for the districts of Walsall Wood, Shelfield, High Heath and Clayhanger, comprising a population of about 6,000. The local board has decided on accepting the scheme prepared by Mr. H. Bertram Nichols, C.E., of Grosvenor Chambers, Corporation Street, Birmingham, who at the last meeting of the board was appointed the engineer to carry out the works. It is intended to proceed with the work immediately. The cost of the scheme is estimated at 9,000*l*. The other schemes submitted were those of Mr. J. E. Willcox, C.E., Birmingham, Mr. W. H. Radford, C.E., Nottingham, and Mr. W. Perry, C.E., Lichfield, all of which received close attention; but the scheme of Mr. Nicholls being more comprehensive and more suitable to the requirements of the district, the board decided in his favour.

WE hear that Mr. J. W. Start, F.S.I., architect and consulting sanitary engineer of Colchester, has been called in by the Farnham United Breweries, Limited, to report upon the best means to be adopted in the disposal of their sewage. Mr. Start carried out the sewage disposal works at the West Bergholt Brewery for Messrs. Daniell & Son's Breweries, Limited, Colchester, about three years ago, which are giving great satisfaction.

THE Liverpool Watch Committee have passed a resolution requesting the Finance Committee to consider the desirability of purchasing a site, recently levelled, in Pall Mall, for a new central fire station, in lieu of that in Hatton Garden, which has long been recognised as inadequate. The cost of the site and new buildings is estimated at 60,000*l*.

THE preamble of the Aberdeen University Bill has been proved before a committee of the House of Lords. The object of the Bill is to obtain sanction for the removal of certain buildings, including the Greyfriars Church, and the extension of the Marischal College Buildings.

THE late Mr. George Dukes, who died at his residence, High Street, Bridlington, has by his will, it is understood, left to his trustees a portion of his estate, to be laid out in the purchase of lands near the towns of Bridlington and Bridlington Quay, to be appropriated as a recreation-ground and park.

THE gas explosion at Blackburn, which caused the destruction of the Crown Hotel and an adjoining shop, and the

loss of five lives, has involved the Corporation of the town in a heavy expenditure, owing to a decision which saddled them with the responsibility for the disaster. A sum of 14,000*l*. has had to be paid in compensation, to meet which the Town Council resolved to raise the price of gas for the next five years by 3*d*. per 1,000 feet.

AT the monthly meeting of the Ilkley Local Board, the Finance Committee recommended that a loan of 90,000*l*. be negotiated for the following purposes, viz.:—17,000*l*. for the purchase of Ilkley Moor, &c.; 55,000*l*. for acquiring the gas undertaking; 12,000*l*. for the improvement of the water supply; 3,000*l*. for costs in procuring the recent Act; and 3,000*l*. to enable the Board to run the gas undertaking until they procure the income from the consumers.

THE *Westminster Budget* for May 5 is exceedingly good. The article on "Mr. Robert Louis Stevenson at Work and at Play," with the illustrations from his island home, will be appreciated, as a change from the general routine of illustrated papers, in which politicians and painters are recognised as the only institutions that exist in the country.

BUILDING AND BUILDERS.

THE sum of 4,200*l*. has been subscribed, and 3,500*l*. invested towards the rebuilding of St. Peter's Church, Oldham, which was erected in 1768.

PLANS have been prepared for a building to include a free library, reading-room and swimming-baths for the inhabitants of Lochee, the late Thomas Cox, of Maulesden, having left a bequest of 10,000*l*. for the purpose.

THE old house formerly the residence of Bishop Heber, at Hubberholme, Skipton, is to be restored as a memorial of the Bishop and for the purposes of a Vicarage.

THE Leith local authority have authorised the building of a fever hospital at East Pilton at a cost of 35,000*l*., plans for which were prepared by Mr. Simpson, architect.

SOME considerable expense is to be gone to in improving the means of exit from the galleries of the Liverpool Philharmonic Society's premises, as required by the city justices.

THE Widnes Town Council have authorised the expenditure of 10,765*l*. in erecting a technical school, to include the free library, according to the plans of Messrs. Woodhouse & Willoughby, architects, of Manchester. The original estimate was 6,000*l*.

ELECTRICAL.

At the Birmingham Municipal Technical School Mr. W. H. Whitehouse, lecturer on telegraphy and telephony, has just delivered the first of a course of eight lectures on the application of electricity to railway working.

THE *Carlisle Journal* says Ponsonby Hall, the ancient seat of the Stanleys, and now in the occupation of Mr. W. B. Turner, has been fitted up with the electric light. The electricity is generated by a turbine driven by water obtained from the Calder, on the bank of which a dynamo-house has been built. The house contains one dynamo which drives the electricity up to the hall, where it is stored in fifty-three accumulators, placed in a room specially adapted for the purpose. From this room the electric light is carried all over the house and distributed in single lights or chandeliers of three or four lights each.

THE PLYMOUTH MARBLES.

THE excellent American monthly, *Stone*, of Indianapolis, contains the following communication from Mr. G. B. Benford:—Prior to my going to England I promised you I would endeavour to get you an article on the limestone marbles of Plymouth, England. To do so and get a correct account I visited the works of J. & E. Goad, of Plymouth, England, who kindly deputed their genial foreman, Mr. Cottier, to show me over their works. Messrs. Goad Brothers have practically a monopoly of these beautiful marbles, having full control of the quarries. They have the most modern appliances for handling goods; they were then getting out columns for a New York house.

I may say that many men in this district and in Canada learned the first use of their tools in that celebrated old business house, notably the late R. Hanger, of Fairhaven and Hydeville, Victoria, one of the pioneers of the marbleised slate industry of this country, and the originator of the Fairhaven Marbleised Slate Mantel Company.

The Plymouth marbles are raised from a great band of Devonian limestone, about half a mile in width, which extends from the Devonport dockyard some six and a half miles easterly, to a place called Sherford. Associated with this run of rock is an isolated patch of considerable extent at Yealmpton, and two or three smaller patches of no commercial importance. The rock

is crystalline, hard and durable; massive, as a rule, in its more central portions, and largely fossiliferous.

For centuries this limestone has been used in the neighbourhood of Plymouth for building purposes; and there are extant structures dating from the fifteenth century, which give it an excellent character as a weather stone—notably, the tower of St. Andrew's Church, at Plymouth. In the seventeenth century it was used in such large undertakings as the Plymouth Citadel; and, in fact, in all the public buildings of the town. With the slightest possible surface oxidation, it has everywhere maintained its face and texture intact.

The hardness of the material seems, however, to have militated against its use as ashlar until comparatively recent years, and its chief employment in ordinary building works has been in rubble masonry, which in the case of dwelling-houses is commonly stuccoed. That it repays, however, and admirably, the labour and cost of perfecting, a number of modern structures show, notably the Plymouth Guildhall and Municipal Buildings, the whole of the exterior masonry of which, dressings excluded, is of this stone.

The most important constructional work in which Plymouth limestone has been used is, however, the well-known Plymouth Breakwater. For this purpose new quarries were opened in the limestone at Oreston seventy years since, and wrought to such an extent for this one undertaking that over 4,000,000 tons were raised and deposited in the sea to form the gigantic mole.

The whole run of Plymouth limestone may be regarded as marble in the sense that it will take a good polish; but in practice this term is restricted to the varieties best suited for ornamental purposes and the larger blocks, the rest being used either for building or for burning into lime. Nor is it more than a century ago that attention was first directed to the value of the Plymouth limestone for ornamental uses. The one fact that throughout the Mediaeval churches of Devon, Purbeck marble is almost universally employed for enrichments, is sufficient to attest that the value and beauty of this local stone was overlooked. Just a century ago, however, a travelled visitor to Plymouth, who probably had his attention called to the stone by its use in the footways of the streets (where, after a shower of rain, being well polished by traffic, it has a strikingly handsome appearance), declared that he thought "the Plymouth marbles were more beautiful than any foreign marbles." Not many years after Polwhele followed suit; and Sir Henry de la Beche, in his "Report on Devon, Cornwall and West Somerset," speaks of some of the local marbles as "extremely hand-

some," and notes:—"Marbles of very great varieties of colour may be obtained, though tints of gray chiefly prevail" (hence the wide scope for judicious selection), "and they deserve to be far more extensively employed than they have hitherto been: a greater demand would cause many more varieties to be worked."

The chief points at which the Plymouth limestones are now worked—some of the older quarries having been abandoned—are Cattedown, Pomphlett, Radford, Oreston and Billacombe, the proprietors being Messrs. Goad & Co. They are not worked specially for marble, but principally for lime and building stone, at the minimum of cost and on the largest scale. It is no unusual thing to bring down thousands of tons at one blast. To procure the marbles the results of each blast are carefully examined, and the suitable blocks, ranging from five tons to 200 tons duly set aside. There is practically no limit to the size of these blocks, except the possibility of moving them; and the economical process adopted secures that there shall be always on hand a large stock of material of every needed scantle, and of the widest variety of colour and figure.

The most forcible proof that has been given of the value of this stone, in the combination of the constructional with the ornamental, is supplied by the Brompton Oratory, already cited, where plinths and columns, pilasters and capitals, panels and courses, of selected Plymouth marbles in rich variety form the chief structural features of the interior. So far as strength is concerned, it is estimated that a load of seventy tons per foot superficial is well within the limits of safety; but the stone has never been known to fail the roughest tests applied to it in the formation of heavy works like seawalls and docks.

The variety presented by the Plymouth marbles is remarkable. The "figure" of the coralline examples is often exceedingly beautiful, sometimes bizarre, especially when the favositæ occur—colloquially called "feathers." Other fossiliferous kinds, again, are picturesquely marked by the sections of included shells, and colour varied.

The range of colour is, however, most remarkable. The prevailing hue is gray of differing shades, but short of positive blue there is almost every other tint that can be named. The richest black, self or varied with white, occurs at Billacombe and Pomphlett. At Billacombe, too, there is raised a curiously brecciated variety, largely composed of creamy, semi-transparent calc spar, relieved by included fragments of reddish-brown rock. Radford supplies, among other kinds, a rich rose red of singular purity. A quarry at Kitley has yielded the most beautiful green marble in the kingdom, clouded and banded in

varying shades between lustrous oil-green and a deep olive. Then there are a tender dove colour, ranging to a delicate lilac; a black with pink veins of very effective character; gray and dove spangled and veined with rose or ruddy brown; a warm chocolate and a glowing yellow, mixed with black, of great rarity and equal beauty. In small pieces, all the colours enumerated may be obtained free from admixture and in great purity. In the larger they are commonly associated as we have indicated, and sometimes the more massive blocks really present a chromatic range of half a dozen different tints and hues.

Some idea of the capabilities of the marble for structural decoration may be conveyed by the fact that single blocks used in the columns of the Brompton Oratory are upwards of 10 feet in height by over 2 feet in diameter, weighing some five tons. But this is only the realised limit of application. Blocks can be had up to any movable and usable dimensions; while so far as quantity goes, the quarries could be worked for another half century without appreciable falling off.

THE CHICAGO EXHIBITION.

ON Monday, the 1st inst., the Chicago World's Fair was formally opened, although all the sections are not complete. In the address by Mr. Davis, the director-general, he stated that the grounds covered 790 acres, on which over 400 structures had been erected, with an aggregate capacity of accommodating upwards of 60,000 persons. The total expenditure on the exhibition amounted to over 100,000,000 dols.

President Cleveland said:—"I am here to join my fellow-citizens in congratulations befitting the occasion. Surrounded by the stupendous results of American enterprise and activity, and in view of the magnificent evidences of American skill and intelligence, we need not fear that these congratulations will be exaggerated. We stand to-day in presence of the oldest nations in the world, pointing to the great achievements exhibited, and asking no allowance on the score of youth. The enthusiasm with which we contemplate our work intensifies the warmth of the greeting we extend to those who come from foreign lands to illustrate with us the growth and progress of human endeavour in the direction of higher civilisation. We, who believe that popular education and the stimulation of the best impulses to our citizens lead the way to the realisation of the proud national destiny which our faith promises, gladly welcome this opportunity of seeing the results, accomplished by

P. A. GILBERT WOOD, 175 Strand, London.

efforts which have been exerted longer than ours in the field of man's improvement, while, in appreciative return, we exhibit the unparalleled advancement and the wonderful accomplishments of a young nation—the present triumphs of a vigorous, self-reliant and independent people. We have built these splendid edifices, but we have also built the magnificent fabric of a popular Government whose grand proportions are seen throughout the world. It is an exalted mission in which we and our guests are engaged. As we co-operate in the inauguration of an enterprise devoted to human enlightenment and in the undertaking which we here enter upon, we exemplify in the noblest sense the brotherhood of nations. Let us hold fast to the meaning that underlies this ceremony. Let us not lose the impressiveness of this moment. As by a touch the machinery which gives life to this vast Exposition is set in motion, so, at the same instant, let our hopes and aspirations awaken forces which, for all time to come, shall influence the welfare, dignity and freedom of mankind.

THE INSTITUTION OF CIVIL ENGINEERS.

THE first of the "James Forrest lectures" has been delivered at the Institution of Civil Engineers, by Dr. William Anderson, F.R.S. The origin of the lectureship was briefly explained. During the session of 1889 the council determined to have a portrait of Mr. Forrest painted for presentation to the institution which he so long served with ability, loyalty and success as secretary, the commission being entrusted to Mr. William M. Palin. Many members expressed a wish to have an engraving of the picture, and a committee was formed outside the council to collect the funds. The surplus, amounting to about 500*l.*, was devoted to the establishment of a James Forrest lectureship, to be administered by the governing body of the institution for the time being, who select the lecturer and also the subject of the lecture.

The subject selected for the opening lecture was "The Interdependence of Abstract Science and Engineering." In the course of his address Dr. Anderson said:—"I imagine that the subject has been chosen because of an uneasy feeling which possesses many thoughtful men that this country is not keeping pace with its neighbours in engineering progress, and that we shall in the future have to pay more attention to abstract science, and its application to practice, than we have been, so

far, in the habit of doing, if we are to come out victorious from the competition, ever increasing in keenness, which we meet with from abroad, and which our system of unrestricted trade tends so much to foster. It is impossible to visit the Continent of Europe, the United States of America, or even our own colonies, without feeling conscious that, in many respects, their engineering works and their factories, to say nothing of their military and naval arsenals, exhibit the great advantages which have accrued from the employment of men of the highest scientific culture in the conduct of those enterprises—that the days are past when an engineer can acquit himself respectably by the aid of mother-wit alone, or of certain constructive instincts, which have been almost the only guides of engineers and manufacturers, even down to quite recent times. It is a matter of extreme surprise to me that so little attention is paid to the science of political economy, that not only the mass of the people, in whose hands the voting power now lies, but even in a great measure the representatives whom they elect, have no systematic training in, and are grossly ignorant of, the principles which lie at the root of national prosperity. It seems to me that a very great national danger is being incurred by this systematic neglect of political economy—an abstract science which had its origin in this country, but where its teachings are ignored in a manner which must end in disaster, the signs of the advent of which are, I fear, only too plainly apparent." Dr. Anderson went on to show how the history of abstract science, by which he intended to designate the history of researches entered into for the sole purpose of acquiring knowledge of the operations of nature and of her laws, without any thought of reward or expectation of pecuniary advantage, had had its reflex in the records of the engineering profession, and how the most recondite investigations, apparently unlikely to have any direct influence on their practice, had in course of time become of cardinal importance. He also pointed out how in these days the engineer must banish from his mind the idea that anything could be too small or too trifling to deserve his attention. "Nothing is too small for the great man" was written over the cottage once occupied by Peter the Great at Saardam. The truth embodied in that legend should ever dwell in their minds, for success, he was persuaded, lay largely in close attention to details. There was nothing in natural science which would not sooner or later prove of advantage to the members of that institution, and which the engineer would not in time turn to the moral as well as to the material advantage of the human race. A cordial vote of thanks to the lecturer was passed.

ELECTRICAL PUMPING PLANT.

AN installation of electrical pumping machinery has just been designed and fixed by Messrs. Easton & Anderson, Limited, 5 Whitehall Place, S.W., and Erith Ironworks, Kent, at the brewery of Messrs. Warwicks & Richardson's, Limited, Newark-on-Trent, which possesses several features of interest. Mr. J. F. Warwick (on behalf of the company), in seeking for an independent supply, found, about a year ago, a source of water suitable for brewery purposes by sinking a well in a field about a mile and an eighth from the brewery, and at the same time conceived the idea of pumping up this water by means of electricity to the tank at the top of the brewery, generating the current at the same place and transmitting it to the pumps by suitable conductors. Accordingly, he placed himself in communication with Messrs. Easton & Anderson, Limited, who undertook to carry out the work, and received the order from the company in September last for doing so. The question at once arose, Should the conductors be overhead or underground? It was manifestly better that they should be underground, as it avoided the use of unsightly poles and wires, which would be more liable to injury, though, of course, more accessible for repairs. The cost of underground cables suitable for the purpose appeared at first sight, however, to put them altogether out of court. There was, however, one circumstance in which this work differed from the ordinary electric transmission plant, and that was that a water-pipe had to be laid to the brewery from the well, and this involved getting out a trench. It occurred to Messrs. Easton & Anderson that if a pair of cables could be laid in the trench at the same time as the pipe, the cost would be very materially reduced, and on going into the matter it was found that while the plan would not be cheaper than posts and naked overhead conductors, it was not very much dearer, so that it was eventually decided to use the underground system. It was thought at one time that the pipe main might have been used for a return instead of a second cable, but the idea was not acted upon. It was considered desirable to be able to automatically vary the speed of the motor by varying that of the engine, and this condition was easily fulfilled by making the dynamo and motor both series wound.

The plant now stands as follows:—The dynamo is of the

"Whitehall" type, having slotted armature and double magnetic circuit, the field magnets being of cast-iron. It is, as before stated, series wound for 360 volts and about 15 amperes at 900 revolutions. It stands on sliding rails and is driven by a link belt from a countershaft, which derives its motion by a belt from a horizontal single-cylinder non-condensing engine, which with the countershaft was already in existence. At present this engine does very little other work, but as it is too large for the pumping it is contemplated to use it for other purposes, and therefore the pulley on the countershaft which drives the dynamo is fitted with friction clutch, which enables the dynamo to be readily started or stopped as required independently of the engine. Suitable fuses and cut-outs are provided in the engine-house, and from them the cable is led to the pumps. An ammeter is also fixed here so that the engine-driver can see that the current is being properly supplied. The cable was made by Messrs. Callender & Co., and is of their armoured type, so that it cannot easily be injured as it lies in the ground. The conductor consists of seven wires, each .054 inch diam., giving a total sectional area of .0155 square inch and a maximum resistance of 2.84 ohms per mile, insulated by means of a solid sheet of vulcanised bitumen, taped and secured with jute yarn, armoured by means of twenty galvanised iron wires, and finished by a braiding of hemp yarn well compounded. It is laid in a special trench for a short distance till it joins the delivery pipe main leading to the tank, and from thence the two go together to the pump-house at a depth of about 2 feet below the surface of the ground. There are only two joints on each of the two cables, and as the workmen laid the pipe they laid the cables, one on each side in the trench, leaving the part to be jointed open till the work was done, when a special man was sent by Messrs. Callender, who made the joints and tested the line. The pipe main consists of 5-inch cast-iron socket and spigot pipe, for the most part jointed in the ordinary way. At one point the pipes have to cross a railway bridge over a canal, and here, in order to occupy as little space as possible, they are of wrought-iron with flange joints, and are made only 4 inches in diameter, carefully enclosed and lagged to keep them from the effects of frost, the cables also being included in the same casing to preserve them from injury. The ground is low and wet, and the pipes and cable in some places pass under ditches, and were then actually laid below the water level. The pump-house is situated a few yards from the well. The outlet from the rising main at the tank is 70 to 80 feet above the surface of the water in the

Price 12s. 6d. Office: 175 Strand, London, W.C.

well. The pumps are of the ordinary three-throw type of Messrs. Easton & Anderson's standard pattern, with gunmetal valves. The barrels are $5\frac{1}{2}$ inches diameter and 12 inches stroke. The pump crankshaft is driven from a countershaft by means of a cast-iron pinion and wheel; and the motor in its turn drives the countershaft through the medium of a gunmetal pinion and a mortice wheel, the teeth of which are accurately machined to a special shape. The motor is fixed on a concrete foundation in such a way that it is readily accessible on all sides, which is a very desirable thing where space permits. It is of the same type as the dynamo, and is likewise series wound, to run with 260 volts at a speed of 600 revolutions, at which the pumps will make 28 revolutions per minute, and are calculated to deliver 5,000 gallons per hour to the brewery. The bearings of the motor are made self-oiling by having each brass bush made in two lengths with a gap between them, in which an endless pitch chain of brass rests on the spindle and dips into an oil-well beneath the bearing. When the spindle rotates it carries the chain round and brings up a supply of oil, which is deposited on the spindle, and finds its way along the bearings by means of grooves, eventually returning from the outer ends of the bearings to the oil receptacle. Thus the motor may run for weeks or even months without any attention to the lubrication being necessary. The lubricators on the pump are of the ordinary needle type, which last a considerable time without attention. For stopping and starting the motor at the pump-house a suitable switch and resistance frame is provided.

BUILDING AND BUILDERS.

THE Plans and Works Committee of the Edinburgh Town Council have approved of plans for the erection of a police and fire station in the Morningside district. The building, which will be situated in Canaan Lane, is estimated to cost about 3,100*l*.

PLANS for new baths at the Pierhead were submitted to the Baths Committee of the Liverpool Corporation at the special meeting. The design shows ample accommodation for the baths, and arrangements for building of six shops on the Pierhead side and a promenade on the side facing the river. It is estimated that the buildings would cost 25,000*l*.

THE Helensburgh Dean of Guild Court has passed plans for a new Liberal club to be erected in Colquhoun Street, adjoining the Union Bank. The building will consist of two storeys, the ground flat containing large billiard-room, caretaker's house, &c., while upstairs there will be a hall capable of accommodating about 200. The hall can be subdivided, and portions set apart for reading-room, recreation-room, &c. There is also a committee-room on this flat. The building will be built of Ballochmyle red stone. The plans have been prepared

by Mr. J. R. Wilson, Helensburgh, and the contracts have been secured by local tradesmen:—Mr. Alexander Miller, mason; Mr. James Ferguson, joiner; Mr. John Horn, plumber; Mr. Allan Armit, plasterer; and Mr. Donal Dempster, slater.

THE *Scotsman* says:—Judging from the number of applications dealt with at the Glasgow Dean of Guild Court, the briskness in the Glasgow building trade is likely to continue for some time. Among the linings granted were:—St. Rollox United Presbyterian Church congregation, to erect a church in Springburn Road; managers of Titwood parish church, to erect buildings in Glencairn Drive, Pollokshields; and Glasgow School Board, to erect buildings in Queen Mary Street, Bridgeton. Altogether there were forty cases before the Court.

THE Partick Dean of Guild Court has granted a lining to the Commissioners of Police to erect new halls, police offices and dwelling-houses in Oswald Street and Park Drive, Whiteinch.

THE Paisley School Board have asked Mr. Thomas L. Watson, architect, Glasgow, to prepare plans for a new school, with accommodation for between 600 and 700 children, to be erected in the playground of the South school, and to consider how the Stevenson Street school can be extended so as to accommodate 200 more scholars.

TRADE NOTES.

WE have been requested to announce that Messrs. Horne, Son & Eversfield, the well-known firm of auctioneers and surveyors, of 84 Basinghall Street, E.C., have removed their City offices to 85 Gresham Street, E.C., in consequence of their Basinghall premises being required by the Corporation for the extension of the City of London Court.

THE tender of Messrs. Kinnear, Moodie & Co., builders, Leith, for the construction of a reclamation embankment on the foreshore, and a wet dock, graving-dock and relative works on the east side of the Harbour of Leith, has been accepted by the Leith Dock Commission.

MR. WM. M. HODGES, manager of the Deimel Light Company, Limited, writes to us as follows:—Our attention having been called to the fact that Messrs. Henry Greene & Sons, of Cannon Street, have announced through the press that the action brought by this company against the Vertmarche lamp for alleged infringement of the Deimel Light Company's

every Design.

patents has been dismissed, we beg to inform you that, although through a technical difficulty the original proceedings taken by this company had to be abandoned, a fresh writ was immediately issued and served upon Messrs. Greene & Sons, and the action will be tried in the ordinary course.

AMONG the wonderful inventions, schemes and improvements that our nineteenth century has produced, the one which has augmented our material comfort in the greatest degree is undoubtedly the introduction of improved ventilation and sanitation. The study of the various systems of ventilation and sanitation offers no small attraction to anyone interested in the public welfare, and to architects, surveyors, builders and property-owners it should be of considerable importance. In matters of vital concern it is advisable to obtain information from the highest authorities, and in ventilating and sanitary engineering Messrs. Baird, Thompson & Co., of Queen Victoria Street, London, and Bath Street, Glasgow, certainly deserve that name, having carried away the highest awards in any competition in which they have entered. Their showrooms are at all times open to visitors, and the various systems of ventilation may be seen in operation. Every venture and every undertaking of this firm has proved a decided success, and the extent to which this new system of ventilation is being adopted both at home and in other countries may be gauged by a glance at the vast foreign, colonial and British connection that Messrs. Baird, Thompson & Co. now possess; but to gain an idea of the advantages to be obtained from the application of the system would mean a long study and investigation of every class of building in which the system has been adopted, including ships, theatres, churches, schools, restaurants, warehouses, mills, factories, &c. The ventilation of all emigrant ships should certainly be a Government question, as also the ventilation of all buildings in which labour is employed, for it is not the length of the hours that shortens the lives of the mill and factory hands, but the impure atmosphere they have to inhale during their hours of work.

ON Monday, the 15th, the joiners of Inverness came out on strike. About three months ago a long and tedious strike was brought to a close by the intervention of Sheriff Blair, and only some minor points were left for adjustment. The men, however, insist on the masters agreeing not to import manufactured material, to pay all workmen alike standard wages, and have foremen on the same engaged terms as workmen. To these terms the masters declined to accede, and workmen to the number of 100 struck work.

VARIETIES.

THE Local Board of Elland have engaged Mr. Malcolm Paterson, M.Inst.C.E., of Bradford, to prepare a preliminary scheme for the drainage and sewage treatment of their town, at a fee of 100*l*. Elland being a woollen manufacturing town on the river Calder, the scheme is to make provision for both trade and domestic refuse, a thorough policy now becoming general in the West Riding, as the only practical means of remedying the evils of the universal river pollution of the industrial rivers of that district.

A MOVEMENT is in progress to improve the lighting of the streets in West Calder by adoption of electric light.

IT is proposed to renovate the interior of St. George's Church, New Mills. Messrs. Preston & Vaughan, architects, Manchester, have been instructed to prepare plans of the work necessary.

IN connection with the "Old Glasgow" exhibition, which is to be held in the Fine Art Institute, Sauchiehall Street, in July, August and September next year, the details of the various sections have been almost completed. The idea of the exhibition originated out of the success which attended the "Old Dundee" exhibition. There are to be seven sections altogether, namely, art, literature, industry, charters, domestic articles, scholastic and ecclesiastical, and distinguished natives and historical events. The history, industrial progress and social life and manners of the city will be fully illustrated in these sections, and a committee, consisting mainly of experts in archaeology, has been organised.

THE Stirling Town Council have decided to reopen communication with the Secretary for War with reference to the condition of Stirling Castle.

IT is stated that Captain Keatinge, of Rhyl, has purchased the Marine Drive Estate, which recently belonged to the National Land Corporation, London, and in consequence of the scarcity of houses will commence building operations immediately. A scheme is also on foot for laying down an electric tramway from Rhyl to Prestatyn.

A MOVEMENT is on foot for the construction of a coach-road through the solitudes of the Sty Head Pass, which, 1,600 feet above sea-level, has hitherto been inaccessible except to people on foot or on horseback. The construction of such a road joining Seathwaite at the north end and Wasdale Head at the south end would give a continuous and uninterrupted coach-road line of communication between Seascale, on the Furness

Railway on the west, and Keswick, the capital of the Lake district. Mr. G. J. Bell, Cumberland county surveyor and bridge master, has surveyed the district, and it is found that the suggestion is practicable, and, almost all necessary materials being on the spot, could be carried out at a cost of about 5,000/.

THE House of Lords have passed the preamble of the Glasgow and South-Western Railway Bill, for the extension of the passenger and goods stations at Greenock and the improvement of the junction of the City Union and the Glasgow and Paisley Joint Stock Railways at Shields.

THE committee appointed for the erection of a free library and technical school, which Colonel Gamble is presenting to St. Helen's at a cost of 20,000/., have decided to invite competitive designs for the building, the premiums offered being 100/., 50/., and 25/.

THE death is announced of Mr. Valentine Green, who carried on business as land agent and architect at Grantham. Mr. Green was widely known and respected throughout South Lincolnshire, having been associated with the erection of many important buildings in the county. He took an active part in surveying the new railway from Grantham to Melton. He held many important appointments, was one of the diocesan surveyors for Lincolnshire, agent for the Duke of Rutland, architect to Lord Dysart's trustees, and managing director of the Bottesford Gas Company. Mr. Green, who was only forty-two years of age, died from an attack of paralysis.

At the quarterly meeting of the Staffordshire County Council the following motion by Mr. H. T. Hinckes was adopted:—"That the technical instruction committee be authorised to expend the capital sums of 8,500/., and 500/., being part of the surplus of the sums placed at the disposal of the committee by the County Council, for the purposes of the erection of the new Technical Education Buildings at Stafford, and that the common seal be affixed to all necessary contracts in connection therewith when approved by the Clerk of the Council." He said the resolution was necessary to give effect to the intentions of the County Council to put up these buildings at Stafford. After open competition amongst various architects, the committee had approved and accepted the plans sent in by Messrs. Bailey & McConnal, of Walsall, whose estimate was 8,430/. In accepting the plans, the committee insisted on some minor alterations, which the architects agreed to, and that the contract should not exceed 8,000/.. They asked sanction to spend 8,500/., on the building, as it was necessary to allow a margin, and they asked to be allowed to spend 500/., on other fittings,

and hoped the expense would not exceed those two sums. With that amount they would be able to put up buildings which would provide the committee with convenient offices for administrative purposes, a suitable residence for the director, and also rooms for classes of all kinds that might be available for students attending from all parts of the county.

THE *Glasgow Herald*, referring to the Corporation Galleries, says:—"A well known local amateur has just deposited in the galleries on loan for a short time a full-length portrait of William Villiers, Viscount Grandison, nephew of King James VI.'s favourite, the Duke of Buckingham, by the famous Flemish painter, Vandyke. It is a work of remarkable beauty and power—one of the earliest and most carefully-completed of the many portraits of English noblemen painted by the great artist during his brief career in England."

ELECTRIC LIGHTING AT ST. SIDWELL'S, SYDENHAM HILL.

THIS house is fitted throughout with the electric light. The supply company's mains enter the building at the stables, and are carried thence to an eight-way double-pole marble distribution board. These circuits conduct the current along the corridors. Cut-outs corresponding to the number of fittings grouped together and mounted on polished teak blocks are placed above the doorway on the outside of each room. This method is of course adopted so that the fuses can be readily found. We very much approve of this system, as oftentimes cut-outs are fixed in almost inaccessible positions. "Silvertown" wire of an insulation resistance of 600 megohms per statute mile was used throughout, and the whitewood casing received two coats of shellac varnish inside and out as a safeguard against the inevitable moisture in a new house. The hall is lighted by two three-light electroliers, the drawing-room with single-light brackets, the dining-room with a five-light electrolier, library three-light ditto, billiard-room with drop lights. The above and all other rooms are also fitted with portable standards. The work, which is of the very highest class, was carried out by Mr. E. Lancaster Burne, of 22 Tufton Street, Dean's Yard, Westminster, for the owner, Mr. John Paddons; and the fittings, of very beautiful design and workmanship, were supplied by Messrs. Richard Crittall & Co., 20 Baker Street, W., and Messrs. Evered & Co., 27 Drury Lane, W.C. The current is supplied by the Crystal Palace and District Electric Supply Co., Limited.

PART OF OLD PALACE, BAMBERG.

IMPERIAL INSTITUTE.

THE warming and ventilation are carried out on the most approved modern principles. Nearly the whole of the basement area of the front building is formed into air-chambers under the basement floor, with a sub-basement corridor running the whole length, and fresh air is brought into these chambers from the outside atmosphere at thirty-two different places, where it is filtered and moistened by passing through a water-spray. In the winter it is warmed in its passage over a series of gilled steam-pipes, and thence conducted to the various rooms in vertical ducts, discharging itself through air-valves in the chimney-breasts controlled by regulators.

The whole of the warming is by steam, and the mains to the various heating-chambers are carried in the subway, where they are fitted with control-cocks to each several section under the immediate supervision of the engineer, enabling him readily to regulate the amount of heat without the necessity of going into the building. The fresh air admission-valves are also worked from the subway, by which the quantity of fresh air which is admitted can also be regulated.

The whole of the corridors and galleries are warmed by steam radiators, provided with fresh air ventilating-tubes through each pipe, and having fresh air admitted to the bases from the outside atmosphere.

The vitiated air is taken from every room and corridor by means of extraction shafts built in the walls, and fitted in the rooms with self-acting floating valves. The whole of these shafts are connected into four main trunks or ducts in the roof, and are carried to the centre tower, where they discharge into the open air. To facilitate the extraction of this vitiated air a pair of engines with a compressed-air plant and receiver is fixed in the general engine-house, and the compressed air is taken to the roof and coupled up to the main trunks in several places, and the end of the pipes fitted with gun-metal nozzles for inducing a rapid outflow of the atmosphere of the rooms into the outer air and cause a constant renewal of the fresh air passing through the various rooms, warmed in the winter and cooled and moistened in the summer.

The whole of the work was carried out by the old-established firm of Clements, Jeakes & Co., who also carried out the fitting-up of the extensive kitchens, larders, and sculleries, which are situated on the top floor, for the service of the refreshment department.

We are glad to notice the rapidity with which Duroline and Carboline are coming to the front, and replacing glass for roofing purposes. The former of these materials has the transparency of glass, but gives a more subdued and agreeable light—an important consideration in buildings of large dimensions. Carboline is an opaque substance, and is used, of course, for roofing simply, whilst Duroline forms the skylights, &c. These in conjunction have been specified and used for the Grand Hall and Prince of Wales's Smoking Pavilion of the Imperial Institute, and carried out by the New Wire-Wove Roofing Co., Limited, giving the utmost satisfaction. The ease with which these materials are fixed is a strong point in their favour, large sheets being fixed from rafter to rafter, the only care necessary being to stretch them tightly. Then, from the view of cost, Duroline and Carboline come considerably cheaper ultimately. There is less timber work, no putty, no rebating, no breakage, and less heat than with glass, and there is less risk of fire. We notice that the New Wire-Wove Roofing Co., Limited, are busy with Government contracts, consisting of skylights required for Dublin Post Office, Dublin Custom House, new Post Office, Brierley Hill; Kirkee Powder Mill (India), &c. Duroline and Carboline have also been adopted in the Hotels Métropole at London and Brighton, for the stables of the London Road Car Co., Limited, &c. The offices of the New Wire-Wove Roofing Co., Limited, are at 75A Queen Victoria Street, E.C.

THE GLASGOW 150-TON CRANE.

THE new 150-ton crane on Finnieston Quay, Glasgow, has been officially tested. This important addition to the equipment of the harbour of Glasgow has been rendered necessary, says the *Herald*, by the great increase in the size of marine boilers and engines constructed in the Glasgow district. At the end of October 1889 the Works Committee of the trustees asked Mr. Deas, their engineer, to ascertain the views of the leading local engineering firms on the question of providing on Finnieston Quay an additional large crane or shear-legs, capable of lifting about 150 tons. Towards the end of the year Mr. Deas reported to the committee the result of his inquiry, and recommended that a steam pillar-crane to lift 130 tons, but tested to 150, should be provided. This recommendation was adopted, and on November 28 following Messrs. Cowans, Sheldon & Co., Limited, Carlisle, were entrusted with the work. The construction of the seat, which was carried out by Mr. Deas's staff, was of a most difficult and tedious character. The river-wall having for some years prior to 1885 been moving forward, through the gradual lowering of the bottom of the river by dredging, its strengthening by sheet piles, 12 inches square, was commenced in the autumn of that year, and it therefore became necessary, in order to take full advantage of the sweep of the crane, to project the river-face of the seat to the extent of 5½ feet at the cope level. This necessitated the construction outside of a 9-inch thick sheet pile tongued and grooved coffer-dam to keep the tide out; the taking down of the quay wall for 52 lineal feet; and the driving of sheet piles on the other three sides, to prevent the ground from slipping. But even although an extension had not been necessary, the wall would have been unable to carry the superstructure. There was certainly a substantial structure entirely of ashlar, 14 feet thick at the bottom and 8 feet at the top, but it was inadequately founded at 25 feet below the cope level, on five rows of red pine, bearing piles 11½ inches square by only 16 feet long, and on 6-inch front sheet piling only 14 feet long. As soon as the coffer-dam was completed the quay wall was removed, the timber sills and runners were lifted and the bearing and sheet piles were drawn. When the enclosure had been excavated to 28 feet below the cope level concrete cylinders of 9 feet 7½ inches external and 5 feet 9½ inches internal diameter were sunk. In the front were placed three triple groups, close behind them four single cylinders and at the back three groups of triple. They all rest upon cast-iron shoes,

and the front groups are at an average depth of 32 feet 8 inches, the single cylinders of 31 feet, and the back groups of 28 feet or 60 feet 8 inches, 59 feet and 56½ feet respectively below the level of the quay wall. The tops of the front cylinders are 25 feet below the cope level, and those between and at the rear 22½. All are filled with Portland cement concrete, and on them rests the mason work, which is 40 feet square, and rises to 45 feet above the top of the front cylinders and 20 feet above the level of the quay wall. It consists of concrete rubble hearting faced to the level of the cope of the quay wall on the waterside with granite quoins and the redressed free-stone ashlar of the old wall, and on the other three sides with heavy rubble. From the level of the quay the facing is of granite quoins at the corners, with ashlar concrete in courses, surmounted by a granite cope 3 feet thick and of a minimum breadth at the centre of each side of 7 feet, and at the corners of 14. The total weight of the masonry above the cylinders is 4,300 tons. The crane is probably the largest steam-pillar crane owned by any harbour trust or dock company in the United Kingdom, if not actually in the world. The framing, shafting and jib are of mild steel; the gearing, so far as is necessary, is of cast steel, and the crane revolves on steel live rollers, working on a steel pathway. The centre is a massive casting, weighing 9 tons, and is held down by six steel bolts, each 38 feet 9 inches in length and 5 inches in diameter. These are fixed to six washer-plates, each 6 feet square, which are built at intervals into the seat at a depth of 30 feet. A brick-lined tunnel 2 feet wide by 10 feet 9 inches radius at centre and 6 feet high, with a manhole and a similar approach from one side of the crane-seat gives the access necessary to fix the cottars on the low ends of the bolts. In this centre casting is the steel centre-pin, which is 17 inches in diameter, and weighs 6 tons. The diameter of the roller path is 33 feet and its weight 12 tons. In the live roller ring there are seventy-five cast-steel rollers of a maximum diameter of 14 inches, weighing in all 10½ tons. The framing is 27 feet in height, and weighs 50 tons. The boiler is 14 feet high by 6 feet in diameter, and weighs 6 tons. The jib, which is two tubes, each 3 feet 3 inches in diameter at the centre, is 90 feet long, and weighs, including stays, 45 tons. Its extreme height from the quay level is 110 feet. The centre of the jib-head pulleys for heavy loads, which are 5 feet 3 inches in diameter, is 100 feet; and for light loads, the pulleys for which are 2 feet 6 inches in diameter, 107 feet 6 inches above the level of the cope of the quay wall. The single-tension rods

MAW & CO., LIMITED, will forward on application Pattern Books or Special Designs, with Estimates for all kinds of Floor and Wall Tiling. Patterns can also be seen and particulars obtained at the Show-rooms at their appointed London Agents, Messrs. W. B. SIMPSON & SONS, 100 St. Martin's Lane, W.C.

are 10 inches by 2½ inches, and the double-tension rods 10 inches by 1½ inches, and the diameter of the pins 8 inches. The whole weighs 8 tons. The diameter of the hoisting drum is 5 feet 2 inches, its length 10 feet, and its weight 10½ tons. The gearing of the crane weighs 8 tons, the castings are in all 120 tons, and the crane, in working order, exclusive of back balance, is 270 tons. In the ballast-box are 100 tons of iron and steel punchings. The crane has two speeds for heavy lifts, 130 and 60 tons, and two for light lifts, 20 and 8 tons respectively. The engine for the heavy lifts has two cylinders, each 12 inches diameter and 16 inches stroke, and the engine for light lifts two, 8 inches diameter and 12 inches stroke. There are two speeds for revolving, and the engine for this purpose has two cylinders, each 8 inches diameter and 12 inches stroke. Plough steel wire ropes, made by the Whitecross Company, Warrington, are used for lifting and lowering, the heavy lifts being taken on eight ropes, 2½ inches diameter, of seven strands—six strands of patent steel round one of soft steel, the outside six giving the strain required. Each strand is composed of eighteen wires, 101 in.—1,346 lb. strain—round 15 wires, 084 in.—983 lb. strain—round 9 wires, 084 in., round 3 wires, 078 in.—803 lb. strain equals 45 wires, and 130 tons strain. The light lifts are taken on a double rope, 1¼ in. diameter, of seven strands, each 37 wires of 060 in. diameter—six of patent steel, and one centre strand of soft steel. The outside strands perform the strain, each wire giving 807 lb. strain equal to 222 wires and 80 tons strain. The gin block for heavy lifts has four pulleys, each 5 ft. 3 in. in diameter, measures 12 ft. by 7 ft. by 3 ft., and weighs about 7 tons. The radius of sweep for the heavy lifts is 65 ft., or 45 ft. beyond the face of the seat, and for the light lifts 69 ft. 9 in., or 49 ft. 9 in. beyond the face of the seat. In a preliminary test made a few days ago, the 60-ton test load was lifted at the rate of 8 ft. 10½ in. per minute, and the 130-ton load at 4 ft. per minute, as against the contracted speeds of 4½ ft. and 2 ft. per minute respectively; while a complete revolution with the former load was made in 2 minutes 17 seconds, and of the latter in 5 minutes, as against the contracted speeds of 3¼ minutes and 6 minutes respectively. The total cost of the crane and seat is under 16,000l. To prevent the possibility of at any time overloading, the crane is provided with a Duckham's 160-ton hydrostatic weighing machine.

At the testing the crane lifted 150 tons of steel rails, and made a complete revolution with the load suspended at about a height of 20 feet.

At the luncheon which followed Mr. Deas, the engineer, in response to the toast of his health, said that sand was admittedly a very unstable material on which to build, but by the use of concrete cylinders which the trustees of upwards of twenty years ago had kindly permitted him to adopt at Plantation and Queen's Dock, a foundation of the firmness of rock was obtained for the crane seat, and the work had been completed and tested without the overstraining of a single bolt or the appearance of a solitary hair-crack in the thousand and more joints of the freestone, concrete, ashlar and granite stones of the outward casing. It was but fair to state that there were at Chatham, Malta, Venice and Spezzia hydraulic cranes capable of lifting 160 tons, but it would be gratifying to the citizens of Glasgow to know that the Clyde Trust possessed the most powerful steam pillar-crane in the world, the largest bucket-dredger and twin-screw hopper barges, and the only elevating-platform steam-ferry for passenger and vehicular cross-river traffic in the universe.

ALSATIAN RESERVOIRS.

ACCORDING to the *Economiste Français*, the construction of mountain reservoirs in Alsace has been in progress during the last ten or twelve years. The work, which at first met with a good deal of opposition from the peasants of the different localities, who looked upon the water which they did not themselves use directly as lost, was carried out by the State. One of the first undertakings was to regulate the two lakes in the valley of Orbey, known as the Black Lake and the White Lake, these two holding 3,000,000 cubic metres of water, so that the cotton and other factories in the valley of Orbey are now able to work all the year round, and there is a constant irrigation of the pastures. The total cost did not exceed 3,000l., and the annual expenditure is only about 160l. A second reservoir was constructed near Sewen, in the valley of Masseraux, not far from the celebrated mountain pass known as the Ballon d'Alsace. This reservoir, surrounded by a wall nearly 90 feet high, contains 1,100,000 cubic metres of water, and is considered such a fine piece of work that a relief plan of it has been sent to the Chicago Exhibition. In 1890 a reservoir was built at Allenweier, in order to regulate the waters of the Fecht, a torrent which has at various times done great damage; and this reservoir, together with three small lakes, also in the valley of Munster, holds about 2,000,000 cubic metres. latest work, commenced last year, was the transformation of the Lauch, in the valley of Guebwiller, into an artificial lake large enough to hold the rain-water which comes down from the surrounding heights and to store it until it is required. This reservoir will have an area of 28 acres and will hold 800,000 cubic metres of water, and, as it is fed by rain-water from a surface of over 1,200 acres, as much as $3\frac{1}{2}$ millions of cubic metres will be collected in the course of the year—that is, when there is an average rainfall. The cost of construction is estimated at 43,250*l.*, of which all but 6,000*l.*, contributed by the town of Guebwiller and the factory-owners of the valley, is found by the State. The reservoir will be finished next year, and will provide motive power for thirty factories and irrigate 4,000 acres of pasture.

PRESSED BRICKS IN CANADA.

NOT more than five or six years have elapsed, says *The Canadian Architect*, since the manufacture of pressed bricks was commenced in Canada. In that brief period, however, the manufacturing firms have multiplied from one to half a dozen, and the process has been perfected to a wonderful degree. In point of hardness, closeness of grain and perfection of form, the pressed bricks at present being manufactured in Canada will compare favourably with those in use anywhere on the Continent or abroad. They are also being produced in a pleasing variety of colour. In view of the success which has been achieved by the manufacturers, it is with much regret that we have observed the otherwise excellent effects obtained by the use of this material well-nigh destroyed in the case of some important buildings recently erected, by the efflorescence of lime-like exudation which, working its way through the pores of the bricks, forms a deposit on the surface. So detrimental is this to the appearance of the building, that unless means can be found to avoid it architects will no doubt feel compelled to cast about for some other material. We learn that the possibility exists of determining in advance of their use whether or not bricks will effloresce, and at the royal testing station of building material at Berlin the test has been applied. The process is described as follows:—The bricks are gradually heated to the boiling point in a waterbath, and are then suddenly immersed in cold water. They are boiled for one hour in a 16 per cent. solution of common salt and frequently cooled as before. They are again boiled half an hour in 5 per cent. soda lye. They are

further boiled half an hour in the same solution with the addition of 1 per cent. of ammonium sulphate. They are then boiled half an hour in a solution containing 2 per cent. blue vitriol and 10 per cent. common salt. Fragments of the brick are placed for seventy-five hours in 3 per cent. hydrochloric acid and for fifty hours more in 5 per cent. hydrochloric acid. By further treatment of the fragments with pure 4 per cent. hydrochloric acid a fluid clear as water is formed which, when treated with barium salts, should not show the presence of sulphates which are the cause of efflorescence. These tests determine the quality of the brick as well, and none which fail to stand the test should be allowed to enter into the construction of a building. We hope that the manufacturers of pressed brick will see the advisability of endeavouring to overcome the objectionable feature of their material to which we have referred.

MANX HARBOURS.

THE committee of the Tynwald Court appointed to consider the scheme of harbour extension in the Isle of Man met at Douglas recently under the presidency of Governor Walpole. Evidence was taken with regard to the proposed bridge across Douglas Harbour, to be erected at an estimated cost of 10,000*l.* The scheme which met with most favour was that for the construction of a bridge at the Royal Hotel corner, in communication with Douglas Head. It was pointed out that this would be a great convenience to visitors, who have now to cross by ferries, would increase traffic and in time pay for itself. On the other hand, it was contended that a bridge in such a position would inconvenience shipping in the harbour, would have to be swung to allow the passage of vessels, and would interfere with berthing accommodation. Evidence was given in favour of a bridge higher up the harbour. It had been suggested that a toll should be levied on passengers to pay expenses, but several witnesses spoke against this and thought the bridge should be free. Evidence was also taken with regard to the proposed extension of the breakwater at Laxey by 50 feet, at a cost of 3,000*l.*, in order to improve the landing accommodation and afford shelter to shipping. At present passengers had to be landed in small boats from steamers at great inconvenience and risk. Some of the witnesses said a 50-foot extension was not sufficient, and that the breakwater should be lengthened at least 100 feet.

THE AUCTIONEERS' INSTITUTE.

THE annual dinner of the Auctioneers' Institute of the United Kingdom (Incorporated) was held on Friday evening at the Inns of Court Hotel, Holborn. Mr. George Brinsley, the president, took the chair, and among those present were Mr. James Catling, Mr. Edward Dodson, Mr. Frank Everill, Mr. George J. Healey, Mr. William Weatherhead, Mr. E. W. Richardson, the Mayors of Chatham and Bangor, Mr. T. Martin (president of the Western Counties Auctioneers' Association), Mr. W. Howgrave (secretary of the Institute of Chartered Accountants), Mr. Bridgman, C.C., and the secretary, Mr. Charles Harris. The toast of the evening, "The Auctioneers' Institute of the United Kingdom," was proposed by Mr. Everill. The chief objects of the association, he said, were to provide a central organisation for auctioneers, estate agents and valuers, and generally to do all such things as from time to time might be necessary to elevate the status and promote the interests of the profession. The Institute also sought to provide for the better definition and protection of the profession by a system of examination and certificates of the results of examinations, without, however, granting, or professing to grant, titles or diplomas. Begun in 1886, it received its charter of incorporation in 1889, and during the last three years the number of its members and the amount of its income had largely increased. All care was taken that its members should be only men of professional reputation and personal character. The system of examination was a step in the right direction, and in years to come would be recognised as the hall-mark of the profession, as in the case of surveyors, civil engineers and accountants. A syllabus for examination was now under consideration, and scholarships would doubtless follow. Lectures of great practical interest had already been started. The Chairman, in acknowledging the toast, said that a good deal of jealousy had been excited by the progress of the Institute, which, however, had no reason for fear. The law ought not to allow a man to obtain an auctioneer's license for 10/. Auctioneers had arduous duties to perform, as in valuations, and for such duties they ought to be sufficiently qualified. Other toasts followed. In the course of the evening it was mentioned

that at a meeting of the Institute in the afternoon a motion in favour of raising in future the qualification for admission from two years to five years was adopted.

A SUSSEX AUCTIONEER.

By the death of Mr. Edward Drawbridge, which occurred at his residence at Scaynes Hill on Friday evening, says the *Sussex Daily News*, Sussex has lost its oldest auctioneer and one of the best known men in its rural districts, one whose years and personal characteristics made him a thorough representative of a bygone period of Sussex life. An auction sale is more than an ordinary event in the average monotony of an agricultural district, and as the central figure on hundreds of such occasions the late Mr. Drawbridge became known to thousands of Sussex folk, as well as to the people of the home counties. With the older generations of the present day Mr. Drawbridge was known as one of the most popular men in his class of business. He possessed a rare fund of humour and quaint old-fashioned sayings, and people would flock to his sales to hear his jocular remarks and enjoy his fun; but, to paraphrase a well-known quotation, "Many who came to laugh remained to buy," Mr. Drawbridge fully believing, as a method of business, in keeping his company in a good humour. When in his prime he was the leading agricultural auctioneer of the county. Younger men have known him as the senior partner of a most successful and respected firm, and regarded him as a living representative of the good old times. Some men change with the age, but in manners, mode of living and style of dress Mr. Drawbridge did not change. Jogging along the rural roads in his dogcart, with clean-shaven face, high hat set well back and white-spotted blue cravat, a truer model of the style of fifty or sixty years ago could not be met with even in rural Sussex.

Mr. Drawbridge was the son of Mr. William Drawbridge, auctioneer, valuer and shopkeeper, of Scaynes Hill. He was born on February 28, 1808, at Scaynes Hill, at the house still serving as the village grocery stores, then occupied by the late Mr. William Drawbridge, who afterwards built the house near the main road, on the summit of the hill, in which, after eighty-five years' activity, Mr. Edward Drawbridge died. He was last out on business on March 18, when he looked over some property at Chailey, about seven weeks before he died, showing his aptitude for business almost to the last. Mr. Drawbridge first went out into the business world as a shopkeeper's assis-

tant, being apprenticed to a Ringmer shopkeeper, a Mr. Martin, afterwards going to Rodmell in a similar situation. For a short time he was in partnership with "Lawyer Burt," at the East Grinstead Brewery, but between fifty and sixty years ago he returned home, and joined his father in his business, the firm being then known as Messrs. Drawbridge & Son. Mr. William Drawbridge died about forty years ago, and his son carried on the business with great success in his own name until 1884, when Mr. Ansell, who had been associated with Mr. Drawbridge in the business since 1877, entered the firm as a most active partner. Through the great age of Mr. Drawbridge the direction of the extensive business of the firm gradually settled upon Mr. Ansell, and during the past two years the younger partner has practically borne the whole responsibility. The business now devolves entirely on Mr. Ansell, who will carry it on as hitherto.

It is impossible to speak too highly of the late Mr. Drawbridge as a business man. He was straightforward and full of integrity and ability. Mr. Drawbridge had business relations with the late Viscount Hampden, with Lord Sheffield, Sir George Prescott, Sir William Grantham, and other county noblemen and gentlemen, while his name was a household word with the farmers. He was in Sheffield Park at the rejoicings on the occasion of the celebration of the marriage of the present Lord Sheffield's father, and also took a prominent part in the coursing meetings which used to be held in Sheffield Park thirty or more years ago. In the "fifties" Mr. Drawbridge looked after the estate of Mr. Morgan Treherne, of Isenhurst, Mayfield—father of the well known Mrs. Weldon—who was then a prominent Sussex gentleman. On the coming-of-age of Mr. Treherne's eldest son the rejoicings were on a very large scale, two barons of beef being roasted to feast the rural folk. The occasion is still referred to by the people, now old, who participated and who remember Mr. Drawbridge acting as carver of one of the ponderous "barons." As an auctioneer he became noted for having obtained 84*l.* an acre for the produce of some larch plantations, such a price being then unheard of, and he finally valued and sold the estate for Mr. Morgan Treherne for 50,000*l.* So pleased was he with the result that Mr. Treherne gave Mr. Drawbridge a present of 1,000*l.* for this transaction. Many other instances could be given of his success in the particular line he pursued.

Mr. Drawbridge, as previously intimated, adhered to the old-fashioned mode of life. His house and office at Scaynes Hill were typical of the homely ease and comfort of rural

Sussex, and most rustically situated for business premises. He was deeply attached to old customs and habits. He loved good cider—always brewing his own—and favoured the long "churchwarden" pipes, although he had no desire to enter into parochial business. He welcomed his visitors with cordial hospitality, old-fashioned grace and urbanity. He adhered rigidly to his one style of dress, and his neckerchief would always be of blue silk with white spots, of a pattern omitted from present-day fashion books, and having to be obtained for him from a special manufactory in Ireland. In his younger days he was a famous "whip." He drove horses that no one else could manage, and was the hero of innumerable spills and accidents, seeming to have a charmed life. His favourite mode of driving was tandem. Mr. Drawbridge lived the very free life that was common in the old days, when among the country squires and farmers money seemed to both lightly come and go. The rural yarns and more or less authentic anecdotes concerning "Old Ned Drawbridge" would fill a volume. A few incidents might perhaps be mentioned to show the character of his escapades. His "old black mare" became as well known as himself. She was bought of Sir Alexander Cockburn—afterwards Lord Chief Justice—then of Wakehurst, Ardingly, who found it required two pairs of reins to hold her in with the assistance of a groom, and it was two or three years before even Mr. Drawbridge could drive her. This he accomplished more by speaking to the mare than by using the reins. He drove home after a sale once from Hastings to Scaynes Hill, about forty-seven miles, remarking at the finish that he thought "he had given his old mare a twister." A much-talked-of incident was his driving through Offham pay gate. He was driving his father at the time, and the horse bolted. Finding he could not pull her up at the closed gate, he whipped the animal and dashed at the obstruction, smashing it in two, and getting through. He remarked to his father, "That's the way to save the toll," but the reply he got was, "That's all very well, but I'll thank you never to try that experiment with me again, Ned." He drove so fast and fearlessly that people were afraid to ride with him, and nothing pleased him better than to get a nervous passenger by his side in his cart. He would drive over rough common, into ditch, hedge or bank, and frighten the wits out of his companion, or perhaps tear madly along the roads several miles away from where the man wished to go. One man who unwittingly accepted his offer of a ride remarked that he had never been overturned in his life. "Oh! that's easily managed," said Mr.

Drawbridge, and driving over a heap of flints, both he and his friend were soon sprawling across the highway. In one of his runaway episodes Mr. Drawbridge knocked over the pump on Newick Green, which has not been erected since. He broke his collar-bone in that spill. One dark and stormy night he drove up to the well-known inn, the Five Bells at Chailey, his old sale manager, Mr. James Brooker, being in the cart with him. He drove so close to the house that his mare's head and the rods of the cart went through the windows. He backed out, and said, "Well, Brooker, I don't think we'll stop now; they won't know who it was," and drove home. Next day, however, he found the people at the inn well knew who it was that tried to drive into the house itself. It is also related that after a market day at Hayward's Heath—in the early hours of the morning—he drove away with a spirited tandem, and after a time pulled up again at the hotel, remarking, "Well, we've got home safe after all. They will be a bit surprised at the Heath when they hear of it." He had been driving round and round in the dark, and instead of being at home was at the point from which he started. It was some time before he heard the last of this adventure. He was fond of practical joking, and often found the joke against himself. Mr. Drawbridge did not marry until 1867, after a courtship of thirty years, his wife dying without family seven years ago. He had a brother, who died in Australia, and three sisters, who also predeceased him, two having reached advanced ages. Mr. Drawbridge was the last surviving member of his family.

LORD GRIMTHORPE'S WORKS AT ST. ALBANS CATHEDRAL.

AFTER many years the restoration works at the grand old Abbey of St. Albans are approaching completion, and whatever may be the opinions held as to the style of architecture which has found favour in the eyes of the restorer, all will admire, says the *Herts and St. Albans Times*, the munificent generosity of Lord Grimthorpe, who during the past thirteen or fourteen years has expended the enormous sum of over 120,000*l.* in repairing and restoring a famous edifice which had through the erosions of time fallen into general decay. It is only here and there that one meets with those who are the possessors of such vast wealth as would enable them to spend a princely fortune for the benefit of the community, and still more rare is it to come

in contact with those who are willing to thus lavishly spend of their substance. It is perhaps scarcely necessary for us to remind our readers that in the seven years previous to 1880 about 40,000*l.*, subscribed by private individuals, was expended on restoration works at the Abbey, but it was then found that although a commencement had only as it were been made, the money came in so slowly as to preclude the hope that the necessary sum to carry out the extensive restorations required would be forthcoming. Sir Gilbert Scott, the late eminent architect, was the directing mind up to 1878, and shortly afterwards the subject of what kind of roof should be placed on the nave was discussed, and a "battle royal" took place between the supporters of the flat roof and the advocates of the pitched roof. In public gatherings and through the press the fight raged for a considerable time, but at length the adherents of the pitched roof, headed by Lord Grimthorpe, carried their point, and not long had elapsed ere his lordship, at a time when funds were scarce and the Restoration Committee were partially at a standstill, made application for and was granted a faculty covering the whole fabric of the edifice.

Taking upon himself the weighty responsibility of restoring the building, Lord Grimthorpe, then Sir Edmund Becket, first directed his attention to the west front, and from his own plans and under his close personal superintendence, the massive and imposing west end was built up, the apex stone of the great cross being duly placed in position by his lordship on July 25, 1883. The bitter controversy which was carried on in the press with regard to the style of architecture which Lord Grimthorpe had chosen will be remembered, and eminent as were the writers who entered the lists, the trenchant, incisive and caustic replies of the restorer practically left him in undisputed possession of the field, but the protests raised, though for a time silenced, ever and anon are again heard, and many architects of eminence still talk of the "vandalism and iconoclasm which has been brought to the greatest perfection at the St. Albans Abbey." The evident indifference of his lordship to the oftentimes unreasonable criticisms on his restoration work quelled for a period the storm which had been raised, but meanwhile the restoration of the nave still went on, and in October 1885 it was reopened for Divine Service, after having been in the hands of the restorer for eight years. The whole of the work in this part of the church has been carried out in the most substantial manner, and there is every reason to suppose that the fabric will stand secure for many centuries to come. In an account of the restoration work his lordship states:—

VOLUME XLVIII. OF THE ARCHITECT.

Handsomely bound in Cloth, Gilt Lettered. Price 12s. 6d.—Office: 175 Strand, London, W.C.

"Where there was originally a wall of 9 inches thick, the thickness has been increased to 9 feet." The five bays at the south-west end of the nave were found to be in a very shaky condition. These were made good and the piers repaired, and attention was then directed to the north and south aisles of the nave, over which high-pitched roofs were erected. Near the great western entrances a flight of five steps has been placed, and the whole of the nave has been refloored with York stone, with marble slabs at intervals. On the western side of the rood screen, generally known by the name of St. Cuthbert's Screen, a new communion table has been placed, and the sacristy space has been enclosed with new dwarf walls. The screen has been extended across the north aisle, the stonework being wrought in the same character of architecture as the central portion. A doorway in this, behind the font, leads to the vestry, and also communicates with the exterior of the edifice. The southern extension of the screen is of carved oak. A new stone pulpit, of cylindrical shape and very massive in construction, has been erected near the fourth pier from the screen on the north side. Substantial choir stalls and a bishop's throne or chair have been introduced for use at the services. Seating accommodation has been provided in the nave for about 1,600, all the seats being free except the upper row of stalls, which is allotted to church officials, and the front pew on the south side, which is reserved for members of the Corporation. The organ has had added to it a new front of metal pipes on the west side, and the instrument can thus be used for services held in the nave, but many are strongly of opinion that it was a great mistake not to divide the organ, and thus admit of an uninterrupted view of the entire length of the building. Passing into the transepts, those who remember their appearance previous to the restoration are immediately struck with the great alterations which have been made. The great north and south windows were formerly of Perpendicular style, but these have both been destroyed, and windows designed by Lord Grimthorpe have been erected in their stead. These alterations proved to be a fruitful source of controversy, and once again was the battle waged with a fierceness and bitterness which ought not to have been imported into a discussion on the merits or demerits of details of restoration work. A circular window, 29 feet in diameter, of the wheel design and of a very massive character, has been inserted in the north front, and beneath it runs a gallery which gives access to a bell turret. The south window now consists of five long lancet lights which, when

viewed from the interior, appear to rise to an equal height, false heads being used to produce that illusion. Viewed exteriorly, however, it is then seen that the lancets really rise into the gable, the centre one being prolonged to the greatest height. These lancets have been called the "Five Sisters," and remind one of a somewhat similar window in York Minster, from which the design is said to have been taken. The central light is 60 feet high, and is therefore the tallest in England.

The old slype, a damp and gloomy chamber, which formerly stood at the end of the south transept, has been rebuilt at a higher level, and is now used as a porch by which entrance can be gained to the church. Into the south wall of this are built some interesting relics in the shape of carved stonework of different dates found in various parts of the church. The doorway leading from the transept to the porch is enriched on its internal side by some fine Norman tracery; this doorway originally led into the cloister from the west face of the north transept. Much of the work had perished, and has been replaced by modern work, but copied so carefully from the original Norman carving that it is difficult to distinguish which is old and which is new. The arcade of Transition Norman work under the great south window also came from the slype. Externally the church has undergone considerable change. High-pitched roofs have been put on the transepts, presbytery and nave, and the new transept-fronts give quite a different appearance to the building. The unique cylindrical Norman turrets which once adorned the western angles have given place to the present quadrangular erections, and at the eastern end massive buttresses have been built up and other work carried out.

The lady chapel, which dates from the reign of Edward II., is a rectangular building of fine proportions, and is 56 feet long and 23 feet wide. It is approached from the ante-chapel, and has at the south-east end the Chapel of the Transfiguration, which will be used as a vestry. The ante-chapel, which is 41 feet long and 77 feet wide, is divided into three aisles, the centre one being rather wider than the lady chapel, and it is intended to use this for a chapter-house, diocesan conferences, &c. Speaking generally of the interior restoration works of the lady chapel, they are of such a character as will commend themselves to those who examine them with an unprejudiced mind, and Lord Grimthorpe is deserving of great praise for the careful manner in which he has used the enormous power he possesses over the building. At the west end, where the old passage passed through the building, there is now a

GOLD MEDAL, Inventions Exhibition, 1885.

sedilia of eleven seats, the centre one being for the highest official dignitary of the church, and on the back of the arch the word "Præsul" is boldly inscribed. The arcading is cut up into five portions of varied design, with delicately carved capitals, cusps, crockets, finials, &c. The old ceiling has been removed and a new one substituted rather plainer in character. In the south aisle a new oak ceiling has taken the place of the old one, and a marble floor is to be put down. Splendidly-carved pierced oak glazed screens cut off the ante-chapel from the presbytery aisles. The old piscina in the south wall of the ante-chapel has a new panel carved in stone, the subject being the vine and birds, and the work has been most delicately carried out. The shrine of St. Amphibalus, which formerly stood in the centre of the ante-chapel, has been removed to the north presbytery aisle, where it has been placed on a new stone plinth, and it is probable that the shrine will find a permanent resting-place here. Viewed from the ante-chapel, the lady chapel now presents a grand and striking appearance. At the western end there is an arch with piers flanked by the old carved niches, with cusped circles above and an inscription on either side, that on the north being

*Sedices anni centum pæne isse feruntur,
Post primæ Albani moenia jacta domus;*

and the inscription on the south is

*Quinquaginta annis et sex Victoria rexit,
Cum domus hæc superat quod fuit ante decus.*

Round the chapel is an elaborately designed arcade on the line of the old work. Starting from a stone seating are moulded bases with triple engaged shafts and beautifully carved capitals, above which are deeply moulded cinquefoil arches, the label mouldings terminating in carved bosses. The spandrels are plain, and there is a moulded string-course running along the top. The east end is more ornate than the north and south sides. The cusp points of the arches are carved, and the string-course is magnificently treated, the carved work, based on naturalistic forms, showing nearly thirty examples of flora. The ancient aumbreys have been retained, and other ancient work has been very carefully dealt with, the object in view having evidently been to restore and not destroy. On the south side of the sanctuary, which is raised by two steps of Derbyshire marble, is the old sedilia, which has septfoil arches, carved label bosses and very delicately-carved cusps. The whole of the carving in stone will well repay close examination, as it is of a most pleasing and varied character, and

it has been based on natural objects. Among the subjects treated are oak, ivy, thorns, filberts, maple, bryony, roses, lilies, pomegranates, figs, sycamore, wheat, vines, passion-flowers, olives, poppies, cherries, strawberries, apples, pears, oranges, lemons, currants, gooseberries, plums, tomatoes, orchids, dog-wood, ash, elm, birch, cedar, pine, pansies, azaleas, maize, walnut, holly, hops, chestnuts, arum lilies, lilies of the valley, marsh mallow, mistletoe, &c., and the remarkable fidelity to nature which the carver has observed is not the least pleasing feature of work which will elicit the admiration of all who examine it. Altogether there are examples of about seventy different specimens of carving in fruit and flowers delineated in the style of the Early Decorated or fourteenth century. Above the sedilia the old canopied niches have been restored where required. The old windows, the design of which has been so frequently admired, have not been interfered with. It will be remembered that they were restored some ten or twelve years ago, when they were reglazed, and in some cases stained-glass was inserted. On the sides above the arcading are splendidly carved corbels on the lines of those at Exeter, and from these spring the ribs of the new groined ceiling of clunch stone, which has replaced the old wooden one. The effect of the roofing is grand, especially when compared with the old one patched with lath and plaster. There are longitudinal, transverse, diagonal and intermediate ribs, with boldly carved bosses at the intersections. The old Jacobean altar-table has been repaired, and will again be used; the altar rail is of oak with iron standards. The floor of the lady chapel, which is now being put down, will consist of marble in 14-inch squares, principally in the form of crosses in black and white, with rouge royal fillings. Over 3,000 slabs will be used, the weight of which is about 40 tons.

The floor of the saints' chapel has been repaved with Yorkshire stone, with slabs of Derbyshire marble at intervals, the pattern being the same as that in the nave. In the south presbytery aisle the old tomb which formerly stood on the south side has been removed to the north side, and now occupies a position adjacent to Duke Humphrey's shrine. The old doorway has been reconstructed, and is now placed in the centre bay, it having previously occupied a position nearer the west end. The arms of the see fill the spandrel on one side and the coat of arms with the crest of Lord Grimthorpe the other. The arcade on the south side of the aisle, which was begun some nineteen years ago under the direction of Sir Gilbert Scott, has been finished out in a most skilful manner, the

subjects of the carved capitals being primroses, maple, vine, thorn and filbert; and the bases of the columns in the north presbytery aisle have also been repaired. Many of the fragments of old work which have been collected during the progress of the work have been erected on the east wall of the saints' chapel, and will be studied with great interest. Exteriorly the windows of the presbytery have been restored and reglazed. New parapets have been erected, the flint work has been repointed, and at the east end turrets with finials replace the old Norman turrets. The east window of the presbytery has been filled in with stained-glass given by Mr. Toulmin many years ago, but which previously had not been used. The exterior roofs of the presbytery and lady chapel are new and have been covered with lead in a most substantial manner, and supporters of the flat roof will be glad to hear that the pitch of the lady chapel roof is very low. The massive wall of the small churchyard on the south side has been removed and light iron railings have been erected, thus enabling a much better view to be obtained of the fabric. The old yew tree has also been removed and other detail work carried out, everything it is scarcely necessary to say having been done entirely regardless of cost, and so far as the eastern part of the cathedral is concerned there has evidently been an honest attempt to preserve what was really worth preserving, and to restore only where restoration was required.

Messrs. W. Longmire & Co. are the builders, Mr. Kaberry clerk of the works, Mr. Hubbard general foreman, Mr. G. Farmer, foreman of the masons, and Mr. John Baker executed the carving.

NATIONAL REGISTRATION OF PLUMBERS.

THE Mayor of Limerick presided at a public meeting held in the Athenæum, Limerick, the other day, under the auspices of the Limerick Local Committee for the National Registration of Plumbers. There was a good attendance of representatives of the Corporation, the medical and architectural professions, the plumbing trade and the general public. Mr. W. Kaye Parry, M.A., B.E., gave an interesting lecture dealing with the relations existing between sanitary plumbing and drainage and the public health. It was pointed out that wherever a proper system of drainage and water supply has been carried out the death-rate has materially decreased, while those countries which are behindhand in sanitary matters have without excep-

tion a constantly higher death-rate. Statistics were quoted showing that for every person who died in England and Wales from typhoid fever between 1885 and 1889 about five persons died from the same disease between the years 1850 and 1854. Reference was made to Dr. Hoare's comparative statement of cases of typhoid fever occurring in clean and dirty houses at Buda Pesth. In this statement the houses were classified under the heads of "good," "fairly good," "dirty" and "very dirty," and it was shown that there were nearly twice as many cases of typhoid in the "very dirty" houses as in the "good" ones.

PATENTS.

[This List of Patents is compiled specially for this Journal by Mr. G. H. Rayner, of the firm of Rayner & Co., Consulting Patent Agents, 37 Chancery Lane, London, W.C., from whom all particulars and information relating to Patents may be had gratuitously.]

APPLICATIONS FOR PATENTS.

- 8685. John Harding, for "Improvements in and relating to doors and movable partitions."
- 8690. Alexander Gray, for "Improvements in hose pipes."

VARIETIES.

LAST week Messrs. Ball, Norris & Hadley sold by auction the corner block of freehold property comprising Nos. 241, 243 and 245 Oxford Street, two doors from Oxford Circus, for 16,300*l.*, a price equal to thirty years' purchase of the present rentals, or 23*l.* a square foot.

THE Kirkcaldy Harbour Commissioners have considered and adopted Mr. Hall Blyth's report on the proposed new harbour for Ravensraig. The undertaking is estimated to cost 300,000*l.*

The first of the Polytechnic trips for the World's Fair, at Chicago, arrived in New York on Friday afternoon last. These trips will be continued every week up to August 5. The parties travel by the Guion Line from Liverpool every fortnight, and from Southampton every Friday and Saturday by the Inman and Hamburg-American Lines. A few vacancies still remain. Full detailed prospectus can be obtained from the Secretary, the Polytechnic, 309 Regent Street.

THE Berlin correspondent of the *Standard* says:—Plans are being made for the construction of a new palace, large enough to contain the Imperial Family and the whole court suite at Belitskaya Pushta, in the province of Grodno. The site chosen is in the midst of the great forest of Pushta, enabling the Emperor of Russia to enjoy the greatest retirement combined with the pleasures of the chase. The cost of the palace will be about three millions.

In the *Boy's Own Paper* an article on "Brasses and Brass-rubbing for Boys" is published by Mr. A. P. Burke Downing.

THE late Mr. George Pownall, surveyor, has left personally valued at 24,810*l.*

THE foundation-stone of the Technical School was laid on Wednesday by Mr. William Hunter, the Master of the Clothworkers' Company, at Halifax. The building is to cost 20,000*l.*

THE appeal brought by the legal representatives of the late Dr. Beaney against the legality of the bequest of 10,000*l.* for the establishment of a free library at Canterbury, England, has resulted in a decision that the bequest is invalid.

THE Special Committee of the City of London Court of Common Council have selected a design for the gold casket to contain the "freedom" for Sir John Gilbert, R.A., the successful competitors being Messrs. Mappin Brothers.

ELECTRICAL.

THE *Windsor and Eton Gazette* says:—We observe that with a view to assisting the development of electric lighting in Windsor, which has hitherto made such tardy progress, Messrs. Laing, Wharton & Down, of 82A New Bond Street and 17 Gracechurch Street, London, have appointed as their resident representative in this locality Mr. Dunning, of 6 Clifton Villas, Devereux Road, Windsor. The firm has, among their larger operations, supplied special artistic electric light fittings to Marlborough House, for the Prince of Wales; to St. James's Palace, for H.R.H. the Duke of York; to Eaton Hall, for the Duke of Westminster; to Lord Windsor and many other gentlemen of rank; numerous extensive installations, such as a complete plant for 2,000 lights for Thring Park, for Lord Rothschild; while among the smaller works have been the installation at St. John's, Beaumont College; fittings for the London residence of Judge Holl, County Court Judge for Windsor.

WITH the gradual extension of electric lighting in Windsor, private "plant" installations are increasing in the surrounding neighbourhood. One of these is at St. John's, the junior division of Beaumont College, Old Windsor. The plant consists of an "Otto" h.p. gas-engine, an Edison Hopkins (Mather & Platt's) dynamo, 59 electrical storage accumulators of 1,888 L. type. The requisite gas is obtained from the Egham Company's main, and the machinery is capable of running at least 210 incandescent lamps of 16 c.p. each, with a current of 150 volts and 85 amperes. Besides the engines and dynamo there are as valuable accessories a Laing, Wharton & Down switchboard, voltmeter, self-recording ammeter, automatic cut-out between the cells and the dynamo, and an over-discharge alarm, the whole being under the charge of Mr. Durrant. The installation was laid down by Messrs. Laing, Wharton & Down, and during the four years it has been in existence it has worked to the satisfaction of the college authorities.

THE *Manchester Guardian* says:—It is expected that incandescent lamps for the electric illumination of the whole of the British Museum will shortly be substituted for the more

elementary system still for the most part prevailing. Incandescent lights, somewhat modified, in their presentation by the requirements of the special position and purpose to which they were to be adapted, have been in partial use in one or two of the galleries and detached apartments of the Museum, especially in the large vase-room of the department of Greek and Roman antiquities and throughout the department of British and Mediaeval antiquities and ethnography. These lights have given great satisfaction, and the frequenters of the reading-room and other parts have lately been encouraged to expect the speedy extension of the system.

A HIGH LEVEL BRIDGE OVER THE MERSEY.

A SCHEME for a high level bridge over the Mersey, rivalling in magnitude the great bridge at New York, has been prepared by Messrs. J. J. Webster, C.E., of Westminster, and Mr. J. T. Wood, C.E., of Liverpool. The bridge is designed on the arch suspension principle, and is to consist of three spans, each of 1,150 feet, the centre span being 150 feet above the river at high water. The plan admits of a roadway 40 feet in width for vehicular traffic, and footways of 7 feet 6 inches on either side. Above is a railway for electric tramcars. Exclusive of this tramway line the cost is estimated at 1,730,000. It is stated that at present there is paid for the conveyance of goods and passengers across the river by lighters, ferry steamers, and the tunnel 195,000. a year, of which 105,000. is paid for goods traffic alone. The promoters estimate that the fact of the bridge being available night and day, whatever the state of weather and tide, would lead to a great increase of traffic, and that the income would be not less than 165,000. a year. The Liverpool approach to the bridge would be from St. George's Crescent, with a gradient of one in 35, and the Birkenhead from Hamilton Square. The bridge will leave the Liverpool side at the landing-stage, touching the Cheshire side at the Wallasey Dock.

THE NEW PIER AT DOVER.

ON Monday the new promenade pier at Dover, which has been in course of construction for the last eighteen months, was opened by Lady Dickeson, the wife of the chairman of the company. The pier is approached from the Marine Parade, and runs out as nearly as possible in the centre of the bay. The

pier is 900 feet in length and 30 feet wide from the entrance gates to the commencement of the pierhead, some 670 feet, when it opens out to a width of 100 feet. There are two embayments on each side of the narrower portion of the pier, in which are placed ornamental kiosks. There are comfortable lounging seats at intervals the whole length of the pier, whilst at each corner of the head circular covered wind-screens are erected, and wind-screens are also placed at other points. The principal architectural feature of the pier will be the pavilion, for the erection of which it is understood that Sir Edward Watkin, on behalf of the South-Eastern Railway directors, has promised to advance the Pier Company the requisite funds. The concert-room in the pavilion will be capable of seating 1,000 people, with a stage 38 feet long by 30 feet wide, green-room, &c. There will also be a spacious dining-room commanding a charming sea-view, refreshment-room, lavatory accommodation, together with four octagonal rooms to be placed at each corner of the pavilion, which can be used as reading-rooms, or for any other purpose. The erection of this pavilion is looked forward to in the town, as it is felt that the success of the undertaking depends to a great extent on this being promptly proceeded with. Lovers of fishing are to receive consideration at the hands of the company, who will set apart a lower deck for their benefit. A landing-stage is also in course of construction, at which pleasure steamers plying between Dover and towns round the coast and to London may land and take up passengers. The pier was designed by Mr. J. J. Webster, C.E., and Mr. A. Thorne was contractor.

After the opening of the pier the chairman of the company entertained upwards of five hundred persons. Sir Richard Dickeson, in proposing "Success to the Promenade Pier," referred to the difficulties which had to be overcome in starting the project. He alluded to the large expenditure which had been entailed in some other coast towns, notably at Folkestone, in erecting similar piers. The contract for the Dover Pier had not exceeded the modest amount of 14,000., and all the expenses included in the outlay would be covered by less than 18,000. In order that the pier might be economically constructed the directors themselves had guaranteed about 3,000. He computed that, by only a moderate use of the pier, even before the pavilion was erected, which they hoped would be started next winter, the pier would earn a dividend of nearly 10 per cent. They did not want to incur debt, and therefore they asked that the rest of the money should be assured before the pavilion was commenced.

VENTILATION.

Special Notice to Architects.

Gentlemen,—As a proof of the confidence we place in our GIBBS PATENT WEATHERPROOF AIR EXTRACTORS, we hereby offer to send at our sole risk to any Architect in the United Kingdom (upon being furnished with satisfactory references) one of our ordinary "Extractors" for competition and comparison with other Ventilators by any maker. If ours is not found superior in every respect, the same to be returned (say, within fourteen days) at our risk and cost; if retained to be paid for at usual rates.—Yours Obediently,

JOHN GIBBS & SON,
WARMING, VENTILATING, AND CONSULTING ENGINEERS,
27 SOUTH JOHN STREET, LIVERPOOL.

No. 9 Registered Design.

No. 1389.

TELEGRAMS—
"VENTILATION, LIVERPOOL."

From the prevailing tendency on the part of unscrupulous advertisers to push the sale of utterly inferior ventilators made of the lightest materials and flimsiest possible construction, we find it advisable to make the foregoing offer. All we desire is fair comparison in quality and price.

PRACTICAL ELECTRICAL PROBLEMS AT CHICAGO.*

IT is not the object of this paper to traverse beforehand the topics which are to be submitted to discussion at the Electrical Congress to be held at Chicago three months hence. The opinion of that Congress is to be taken upon certain matters of utmost importance, such as the final adoption of international units and standards, as well as other questions of nomenclature which are of international convenience. To attempt to forestall the decisions of the Congress on these or other matters by raising a discussion on them here would be both ill-timed and discourteous. My object is entirely other. It is, in brief, to draw your attention to a number of matters which are at present engaging the notice of electricians, matters which are for the most part on the verge of scientific progress, matters partly within and partly without the range of the practical electrician. From that border-region, just outside the limit of actual commercial practice, must inevitably come the next advances in the industry. Every one who is familiar with the history of inventions knows how it is that, before any great world-compelling invention takes practical form and shape it is more or less consciously existent; it is "in the air"; the pioneers are alive to its possibilities, though they may be accounted but as dreamers of the impractical. Discovery of the abstract order, often unrecognised as to its importance, yet none the less pregnant of result, almost invariably precedes invention. The task of reducing to serviceable form, fit for use, the newly-discovered abstract truths is the problem before the inventor, who, indeed, may be both discoverer and inventor in one, the pioneer both in science and in industry. Of late there has been a lull in electrical invention. Not that the footsteps of inventors have ceased to dog the Patent Office, or that the streams of out-flowing specifications have been dried up. It is the quality, rather than the quantity, of recent electrical inventions that has declined. Those eventful years, from 1873 to 1883, which may be said almost to have created the modern electrical industry, saw the introduction of many radically new inventions, many really novel departures in the application of science, and the very fertility of that harvest of invention seems to have for a time exhausted the soil.

But the apparent pause in the progress of events is the real

* A paper by Professor Silvanus P. Thompson, D.Sc., F.R.S., read at the meeting of the Society of Arts on the 3rd inst.

time for the progress of ideas, the epoch for the incubation of new suggestions. Once the new ideas have taken form and growth the development from them of new inventions is a logical certainty. The new inventions must and will come. We seem now to be approaching the close of the period of lull, and the new ideas that have been gradually spreading and rooting may be expected to crop up in invention. We seem to be treading on the verge of new methods, new appliances, new results.

At such a time, as circumstances have decreed, we are to meet our electrical brethren, not only of the United States—but that home of free ideas and unbiassed progressiveness—but also of other countries, in friendly converse as to the progress of that art and science in which we are most interested. We shall rub shoulders, and exchange views and opinions with them, discuss our special varieties of practice, our special points of experience, our expectations and hopes and doubts. We shall have much to learn from one another; and, in the amicable rivalry of nations, we shall all be keen to make the most of our opportunities.

What, then, are the points that will interest us most? What are the burning questions that will awake our attention? Let us begin with some more sternly practical questions that confront the electrical engineer. The methods of working that prevail in the matter of electric light and power present many points of divergence between different nations. One cannot help raising the inquiry why these divergences exist, and whether amongst them there is not a best way to be chosen? Let us consider them in detail.

Not only do we find divergences in the types of generating plant in habitual use in central stations, we find differences in the modes of distribution, even in the methods of house-wiring, differences which are not mere matters of taste or fashion. In the average English central station the dynamos are few and massive, and, for the most part, are mounted so as to be direct-driven each by its own separate high-speed engine. Belting and countershafts are conspicuously absent. In the average German central station, though both engines and dynamos differ in type from the English, direct-driving is almost universal. The main difference—as between British and German practice—is that in England, where land is dear, we build compact high-speed dynamos, and design special engines to suit them; whilst in Germany, where compactness is no great advantage, large slow-speed multipolar dynamos are designed to suit the large slow-speed engines. Contrast with this the average

American lighting station. The dynamos are not designed for the engines, nor the engines for the dynamos, and neither of them is specially designed for the particular station where it is to be erected. Both of them are, so to speak, taken from the stock of some particular factory; and as the dynamos are comparatively small, numerous and high-speed, whilst the engines are few, large and of slow speed, being ordinary factory or mill engines for the most part, engines and dynamos cannot be coupled direct, but must be geared by the intervention of countershafts, pulleys and belting. Not that there are some fine exceptions; for example, the Elm Street Edison Station in New York, the machinery of which was designed by Mr. Van Vleck, after a tour of inspection in Europe. Also some recent large combined plant of the Westinghouse Company. But for the most part, the leather belting is the one conspicuous feature of an American lighting station. Take, for example, that of St. Louis, Missouri, the largest arc-lighting station in the world. The engines are ten in number on the ground floor. They are single expansion engines of the Corliss type. The dynamos, 53 in number, are on the second floor. The whole of the first floor of the building is given up to a magnificent array of long countershafts, carrying some 70 pulleys, and leather belts, receiving power from below, and transmitting it to the floor above. Our cousins evidently believe in the truth of the adage that there is nothing like leather. We have absolutely nothing to show like this on our side, the nearest approach being the Westinghouse Station of the Metropolitan Company at Sardinia Street. This is an alternate current incandescent station, with all the engines on the ground floor, and all the dynamos on the floor above.

That it may not be said that I am giving, as an example, an old station, built in the dim and distant past of 1891, let me set alongside the St. Louis example the very latest one that came to hand but two days ago in the *Electrical World* (New York) of April 22, 1893. Therein is described the new central station of the city of Akron, Ohio, where there are four compressed condensing engines and seventeen dynamos, all belt-driven, and all on the same floor.

Compare this with such stations as ours of Manchester Square, or of St. Pancras, or the stations of the Westminster Company, or of the Kensington and Knightsbridge Company, or those of the St. James's Company. In none of these is there any countershafting or belting. Nor is there in the new Glasgow station; nor will there be for the new machines of the City of London Electric Lighting Company, at Bankside,

though in the temporary and transition plant rope-driving without countershafts has been employed. Not that I would dispute that there are advantages in driving by the aid of belts. The method has the obvious advantage that if a bad short-circuit occur, the belt is thrown off or broken before any other damage is done. In other words, it prevents armatures which are of inferior mechanical construction from being destroyed by an accident which ought to have been entirely impossible of occurrence.

Not only in the matter of direct driving, but in the whole design and construction of station switchboards, does practice diverge. The British engineer desires to have everything as solidly simple as possible. His ideal is simply a pair of omnibus bars, into which all the dynamos feed in parallel, and from which all the feeder-mains run off to the various circuits of the distribution. In some cases he falls short of this sweet simplicity, especially in those stations where a battery of accumulators is used, but that is what he desires to attain to. The American switchboard evinces an almost equally strongly marked ideal, the desire being to divide up the circuits and the generators into as many separate units as possible, while retaining the possibility of connecting up any one of the dynamos singly with any one of the separate circuits. The most recent and elaborate of such switchboards, resembling in the quantuplicity of its parts the multiple switchboard of a telephone exchange, is figured in the supplementary issue of the *Electrical Review* (New York) for February 25, 1893. It is the switchboard specially designed for the Manhattan lighting station, and is so contrived that, with seventeen circuits and nineteen dynamos, by no possibility can any two of the dynamos be put into parallel with one another.

Practice differs again in the mode of distribution by mains. An electric-light pole, and having a transformer hung on to it, where it brings the current to your house, is a sight which cannot be seen in England, simply because it does not exist. Our transformers are almost always put in fireproof cellars, and our mains run underground in conduits instead of overhead on poles.

In house-wiring, too, practice differs. The wooden casing that, thanks to the fire-office rules, is almost universal in England, is by no means universal elsewhere, and in some countries is almost unknown. It is probably destined to disappear in time, when safer modes of carrying wires are recognised. Wood-casing has three grave defects—it is neither damp-proof nor incombustible, and too often it covers, like charity, a

multitude of sins. In this connection it is important to note that, in spite of the curious predilection of so many of our fire offices toward the use of wooden casing, the proportion of electrically-caused fires in this country is extremely low. This satisfactory circumstance must be attributed, not to the general use of wood-casing for house-wires, but rather to the very wholesome dread inspired by the vigilant and able surveyors of the chief fire offices, of whom Mr. Musgrave Heaphy is the most eminent, and who have, in spite of the curses so frequently showered upon their heads, insisted upon the prime requisites of good material and sound workmanship in all risks that they undertake to insure. If their requirements have seemed, in individual cases, hard or arbitrary, they have done incalculable good in stamping out the inferior work of scamping contractors. It is an open secret that some of the New York fire offices have become of late very uneasy about the increasing prevalence of electrically-caused fires. It is even stated, though I cannot name my authority for the information, that some of them have recently sent representatives to this country to learn how we manage to keep electric lighting safe. Doubtless we shall, at Chicago, exchange opinions on many of the details of this highly practical question. What is wanted is a mode of running the wires and fixing the switches and other accessories that shall not only be electric-tight, but shall also be water-tight, gas-tight, air-tight, oil-tight, fire-tight and rat-tight.

Upon the question of the degree of incandescence at which it is most economical to run glow-lamps, we shall probably find differences of opinion. It is obvious that the "smashing point" at which it pays to destroy old lamps depends upon the market price of lamps—a factor of the problem which is just now of a very uncertain nature. Whether Mr. Westinghouse's "stopper" lamp is made a commercial success or not, it is clear we are on the eve of a great revolution in the price of lamps. When they are really cheap, we shall give them short lives and merry ones, working them while they last at a higher degree of brightness, and therefore of efficiency.

Another battle of opinions, that will doubtless break out, will revive old controversy as to the relative merits of alternating and direct currents. The advocates of accumulators will come armed with the latest statistics to support the direct current, whilst the advocates of alternate currents will be challenged to produce practical motors that can be put upon their circuits. The great success of accumulator stations in England will doubtless whet the curiosity of our brethren, and inspire

them to point us to some still greater success of some other system on their side. It is very singular to remember in this connection that at the Philadelphia exhibition in 1884 there was not a single alternate-current dynamo shown—there was not, indeed, a single one in existence in the States, all machines at that date being for direct currents. Contrasting that epoch with the present, the growth of alternate-current systems to their present development seems truly remarkable. For now we have not only to discuss the general merits of alternate-current as against those of direct-current systems, but the relative merits of high-frequency as against those of low-frequency alternations, the merits of high-voltage as against those of low-voltage systems, and the merits of three-phase and four-phase alternate-current systems as against the simple ordinary two-phase alternate-current system. Possibly many of us are becoming tired of the eternal *drehstrom* question. The three-phase, high-voltage, long-distance transmission from Lauffen to Frankfurt eighteen months ago was a magnificent *tour de force*. It showed what could be done. The generators of that splendid experiment are still running to illuminate the town of Heilbronn. But it must be confessed that even here the three-phase system has remarkably little to show of advantage over the universal two-phase system. The complications it introduces by its substitution of three wires for two are not compensated for by any great gain. The supposed advantage that it permits the use of self-starting non-synchronous motors is apparently illusory; for it is clear that if the problem of giving us a satisfactory alternate-current motor, suitable for use on an ordinary two-phase circuit, has not been solved by Messrs. Hutin & Leblanc, it will be solved by Messrs. Stanley & Kelly, or by the engineers of the Oerlikon Fabrik, or by Messrs. Brown, Boveri & Co., or perhaps by all of these able engineers in as many different ways. As for any supposed superiority in other respects of a three-phase or a four-phase motor over a two-phase one, it is merely a question of plant-efficiency and of comparative unimportance.

Much more attention will, probably, be given to the battle of the frequencies. Very low frequency currents will apparently serve certain purposes that will make them of special use in particular cases. Many years ago M. Abdank proposed to use them for telephone signalling and to replace telephone batteries. On the larger scale, though excellent for operating motors, they are distinctly bad for arc lighting. In the processes of simplification in central station work we want to be able to run the arc and incandescent circuits off the same

simple pair of omnibus bars. If this ideal is ever to be obtained—and Mr. Ferranti tells us it is within our grasp—we shall have to keep up the frequency of our alternations, not lower it. In the other extreme direction we have had a most enticing field opened out by the researches of Mr. Tesla, and of Professor Elihu Thomson, upon very high frequencies. The strange properties of high frequency discharges when supplied at very high voltages raise new problems. We want, as a new invention, a frequency-raiser—an organ which shall transform the frequency, even as the induction-coil transforms the voltage. The frequency-transformers hitherto used in the laboratory for purposes of research—namely, the Leyden jar and Herz oscillator—are not practical for electric-lighting purposes. The phosphorescent glow of the novel high-frequency, high-voltage, high-vacuum lamps that Mr. Tesla promises us, costs as yet much more for equal quantities of light than any other form of electric illumination. Who will make the new departure that will bring such lamps within practical range?

We shall discuss high-voltage, too, from another point, namely, that of the utilisation of Niagara and other natural sources of power, by permitting of the economic transmission of power to long distances. Ever since 1879 this dazzling possibility has been before us. We may yet see Lord Kelvin's 80,000 volt transmission an accomplished fact. The three suggestions made in that year to attain an efficient high voltage have all been tried. Professors Ayrton and Perry's was to run the dynamo and motor both at a higher speed. Professors Thomson and Houston's was to put several dynamos and several motors in series. M. Achard's was to work with more powerful magnets in the machines. All three suggestions have their good points. They have been tried at Munich, at Creil, at the Gare du Nord in Paris, and notably at Frankfurt; but they have also been put into practical use by the aid of transformers, in scores of other places, and are at work to-day. What shall the next step be? Perhaps, at Chicago, we may hear from Professor Forbes exactly what is to be done at Niagara.

Closely connected with power transmission comes the problem of the electric railway, and the question of rapid transit by electrical means. Several thousands of electrically-worked tramway lines throughout the length and breadth of America attest the extraordinary progress of recent years. And if America cannot yet show one single electric railway on the scale of our City and South London line, it is probably because she has some great surprise in this direction in store

for us, and will throw our present advantage in this point into insignificance. Subsoil roads are certainly going to revolutionise the cross-traffic of all great cities. But will not America show us something much bigger and more daring than our little six-mile pair of tunnels from King William Street to Stockwell?

The applications of electricity to mining must also come in for discussion, and many other engineering applications. Many engineers are now alive to the possibilities of electromagnetic mechanism. Friction clutches are being superseded by magnetic ones; and a recent suggestion of Mr. Edison is to increase the grip between belts and pulleys by the introduction of magnetic adherence between them.

Turning from the problems of heavy engineering to those of lighter electrical appliances, there are still matters innumerable awaiting discussion. We shall have the new "telautograph" of Professor Elisha Gray to admire. We shall canvass the probabilities of its adoption and development as keenly as we did, nearly twenty years back, those of the telephone. It is a matter of congratulation that Dr. Gray, who at that time was somewhat cruelly pushed aside, in the pressure of events, from receiving his due share of recognition for the part he played in the early stages of telephonic progress, should now have made such an apparent success with the later creation of his inventive brain. The cruder tentative autographic telegraphs of the earlier workers cannot be put into the same line as the wonderfully perfect instrument which will assuredly be one of the features of the Chicago show. But there are other battles to fight in the telegraphic field. Our system of rapid automatic transmission, originated by Wheatstone, and perfected steadily and surely under the hands of the British Postal Telegraph Department, has not yet superseded all the older and slower forms of telegraphic instruments, even on those lines where press work and heavy commercial work demand the most perfect and efficient instruments. It is strange that in the United States, where such commercial considerations are deemed quite as important as they are with us, the adoption of the rapid automatic system should have been so slow. American telegraphers were not one whit less quick than we to perceive the advantages of duplex and of quadruplex working. In respect to quadruplex, though Europeans worked out both duplex and diplex, and had shown that by combining them a quadruplex transmission was possible, it was yet left to American electricians to put it into service and to devise the practical combinations for everyday use.

Electric Light Engineers, LYRIC CHAMBERS, WHITCOMB STREET, W.C.

Vol. XLVIII. of THE ARCHITECT. Handsomely Bound in Cloth, Gilt Lettered, Price 12s. 6d. Office—175 Strand, London, W.C.

The problem of the fuller utilisation of telegraph and telephone lines takes fresh importance every year as traffic thickens and the possibility of adding new lines beside those already darkening the air is narrowed down. Rapid automatic transmission is, for many purposes, a far more efficient service than the quadruplex. Then there is the question of harmonic duplex and multiplex telegraphs. There is the problem of multiplex service by the distributing device of Delaney, which is already being tried in the British telegraph system. At Chicago we shall see the phonopore doing service not only as a harmonic duplex but also for providing a telephonic service upon the railway signal lines to keep up communication from cabin to cabin of the block system. This ingenious adaptation of devices has received, since its inception by Mr. Langdon-Davies, numerous improvements in detail of late from that ever active veteran telegraph engineer, Mr. Spagnoletti, and I am told that the instruments at Chicago will also embody the results of some suggestions made by the officials of the British Post-office when the instruments were tried there.

The rapidity of signalling through cables is a matter to which our President of to-night—the official representative of Great Britain in matters electrical—has given much attention. He has shown us what careful design may accomplish in the matter of the telephone cables from England to France and from England to Ireland. The next step will be to show that it is possible to talk by telephone through the 120 miles of sea that separate England from Holland. There is not the least reason why that should not be done within the next twelve months. This is a matter to which recently I, too, have been giving some attention; and it is perfectly clear to me that, by taking into account the action of electro-magnetic induction in diminishing the retarding effects of capacity, and utilising that property rightly, it is only a question of time and money to effect telephonic communication through even an Atlantic cable. It is possible that at the present moment no two telegraph engineers would agree on the right way to carry out the thing. Few, if any, would deny the abstract possibility. It affords a splendid field for discussion. Above everything we want a few suitable hard facts of experiment as data to base argument and calculation upon. What seems certain is that there will be no more Atlantic cables built on the old plan, with a single conductor enclosed within an external armouring of iron. That type of cable is doomed for all rapid work. Long-distance telephony is no mere dream. Nor is hekto-plex telegraphy. And telegraphy without wires is already in iso-

lated cases an accomplished fact. Seeing by electricity, in spite of the telephonoscope which graced the Jubilee soiree of the Postal Telegraph Office, must be left to the twentieth century. We have problems enough to discuss at Chicago without entering upon that enticing phantom.

I have not time to enlarge upon electro-chemical themes, but we have many projects ripe for discussion. New methods of recovering and refining metals. The use of electricity in the preparation of chemicals, such as caustic soda, for the rectifying of oils and alcohols, and for the production of chlorine, ozone and bleaching liquors. The application, too, of electricity to hasten tanning and other similar processes of electric osmose deserves careful discussion. Electrolytic synthesis is an almost unworked line of investigation, and ought to be as fruitful as the electrolytic analysis that underlies all the plating and typing processes.

Those of us who may enjoy the benefits of a trip to Chicago will, it is clear, have to encounter a perfect tornado of electrical ideas. We go to mingle with our brethren of the electrical craft in friendly converse—as admirers, let us trust, rather than as critics. On whatever points of practice we differ, we may be sure the advantage is not all on our side, and shall be ready to give a hearty appreciation to and to enter into an intelligent understanding of the causes that produced those differences of practice, even when they are differences that tell against ourselves. There are moments when one would wish to dispossess one's self of the critical faculty and instead acquire an unlimited capacity for admiration. The exhibition itself will give us much matter for genuine admiration; the Congress will equally furnish us with food for thought. The country which produced a Franklin, a Henry and a Morse is happily still rich in citizens of distinction in electrical science, for it can boast a galaxy of names as eminent as those that can be produced by any country in Europe; as eminent not in abstract science only, but also in the work of pioneer investigation and in the genius for utilising the forces of nature for practical ends.

the former. For hanging the casements brass hinges have been abandoned for steel pivots, with satisfactory results. The fittings throughout are made at his own works, and no effort is spared to introduce a high standard of workmanship. The prices of the casements are regulated by the quality of the fittings, the casements being equally well finished throughout, and any special design of fittings in hammered iron can be carried out. Attention may be drawn to the newly-perfected casements opening in pairs. These casements are made to open inwards also, and are guaranteed absolutely weathertight. The fixed centre striking bar has been done away with. All the sections illustrated are alike suitable for stone, terra-cotta, brick or wood details, and any of them can be made in gun-metal or bronze. The window-opening gearing, a rapidly developing part of the business, is dealt with at some length, and well illustrated, showing a number of kinds of ventilating gearing, and space has also been found to illustrate art metal-work. The list of testimonials from well-known architects is a tribute to Mr. Wragge's enterprise, and his success in pleasing his clients.

New catalogues, as we previously mentioned, have been issued by the Edison & Swan United Electric Light Company, Limited, of 100 Victoria Street, S.W. The first, or Section I., deals with incandescent lamps. A very handsome variety of these are shown, and it is evident that the illustrations have been made with great care. These range from miniature to full sizes, and there are numberless illustrations of lamps for all kinds of special purposes; for instance, to mention one, there is a lamp specially designed for running under water, also for use in gunpowder mills, miners' lamps, for use in ships, for railway carriages, &c. Much interest attaches to the various lamps designed for all kinds of buildings, houses, mansions, hotels, restaurants, &c. The same remark holds good of the different designs shown for fancy lamps. Among the illustrations is one showing the offices at Ponder's End, where the company have their chief works. The interior of one of the fitting shops at these works is also shown.

Section II., which comprises between sixty and seventy pages, is devoted to electric light installation fittings. Every possible article seems to find a place in this list necessary or advantageous for any electric light installation, even ornamental reflectors and fancy shades not being overlooked, the latter being shown in coloured illustrations. One illustration that should have special interest just now shows a large Main Switchboard made for use at the Imperial Institute.

Section III. is concerned with electric light measuring instruments, and one feature of this list is the interesting and exhaustive descriptions given of various instruments. It is not possible to study the list without being struck with the strides that are being daily made in regard to the use of electricity.

ARCHITECTS AS BUILDERS.

AN action was brought by the committee of the Newport Athletic Club against Messrs. A. O. Watkins & Sons, architects, to recover 88*l.* 4*s.* 8*d.* as damages for breach of contract. It was remitted from the High Court to the local County Court. The *South Wales Daily Star* gives the following account of the proceedings:—

Mr. Hornby said the nominal plaintiffs were Mr. Edwards Bellerby and Mr. W. C. Phillips, who signed the agreement. About 1888 the Athletic Club decided to build a gymnasium. The present defendants were the architects, and another firm, not connected with the present action, were the builders. The building proceeded to within a reasonable distance of completion, when it showed signs of collapse. He did not think that would be disputed. On October 1, 1889, the defendants wrote a letter to plaintiffs in which they suggested certain things as a reason for the collapse, and in October 1889 a dispute arose as to why the building had given way. At the time it gave way it was, by the instruction of the defendants, propped or shored up to prevent it from further giving way. Just after the building was propped up it was inspected on behalf of the plaintiff club, and the gentlemen who then inspected it made certain recommendations as to what should be done. After considerable correspondence the agreement of March 21, 1890, was entered into. The defendant undertook for the sum of 650*l.* to finish the gymnasium, and give a guarantee for two years and a half. By this the position of Messrs. Watkins & Son was considerably altered; they had been the architects and servants of the club, but they now became the contractors.

His Honour: Was any other architect engaged?

Mr. Hornby: No.

His Honour: Then they were practically the architects and builders?

Mr. Hornby replied that that was so. The building was carried on by Messrs. Watkins & Son, and on September 1 the defendants wrote giving notice that they had completed their contract, and asking that the balance of the account should be

paid. After the receipt of this letter the committee of the club appointed a sub-committee to inspect the building. The sub-committee attended the gymnasium on September 3, and they pointed out to Mr. Watkins certain things, the principal of which was the state of the floor for the purpose of lawn tennis. Mr. Edgar Watkins promised that these should be remedied. On the 8th the sub-committee found that these little things had been done, and recommended that the balance of the amount of the contract should be paid and the building taken over. Having regard to the fact that the building had previously to a certain extent collapsed, the committee thought they ought to have the building inspected to see whether it was fit for the purposes for which it had been erected. Three gentlemen, Messrs. C. W. E. Marsh, Togarmah Rees and T. D. Roberts, were requested by the plaintiff club to make an inspection of the building, and on October 20 they made a report in which they recommended certain alterations, but these were not carried out. Matters went on until July. At that time Mr. Marsh went to the gymnasium and noticed certain signs in the building. Having regard to the report he had previously made he recommended that some one should be engaged to inspect the building to see if it was necessary that anything should be done to it, and if so what. On Mr. Marsh's recommendation Mr. John McKaig was appointed, and attended several times at the gymnasium. On September 21, 1892, he sent in his report, which recommended a more elaborate scheme than had been carried out. He contended that the defendants were liable for the defects which had been found in the building before the time of the guarantee had expired.

A discussion took place as to the value of the work that had been done, and Mr. Bailhache, for the defendant, said that if the work was necessary they were willing to pay a sum that should be decided upon by Mr. John Linton.

Mr. Hornby inquired what Mr. Bailhache valued the buttresses at?

Mr. Bailhache said there were eight buttresses, which were worth 5%.

Mr. Hornby: We say they are worth 10%. We cannot agree to that.

After some further discussion it was decided that should his Honour decide in favour of the plaintiffs, the cost of the work should be referred to Mr. Hitchcox.

Mr. Hornby, continuing, read the correspondence which had taken place with defendants on the subject, in which they denied that the work which had been done was necessary. He

inquired if there was any dispute as to the condition of the building in 1889.

Mr. Bailhache said there was not. He suggested that no claim could arise under Clause 1 of the agreement. If they had a claim against the defendant, it came under Clause 8. He contended that the buttresses were absolutely useless, and did more harm than good.

In answer to his Honour, Mr. Bailhache said that he could not dispute defendants' liability for the condition of the building for two and a half years.

His Honour: Then I have to consider the cause of the defects and the means to remedy them.

Mr. B. Lawrence said that in October 1889 he was called upon to examine the building. The roof was about quarter covered, and the whole building had got into a state of collapse on account of the weight of the tiles. The piers on the north and south were off the perpendicular to the extent of 6 or 8 inches. The building was not safe, and he ordered the contractor to stop immediately as it was in a dangerous condition.

Mr. McKay, an engineer at the Isca Foundry, deposed that in August 1892 he was requested to report upon the state of the building. He then knew nothing of the agreement, or of the probability of an action against anyone. There were structural defects in the building, and the ribs were not strong enough for the purpose for which they were intended. He mentioned other defects in the building.

Mr. Togarmah Rees, C.E., said he inspected the building on October 9, 1890, in company with Mr. Marsh and Mr. Roberts. They prepared a report, which recommended that the building should be strengthened. He examined the building this month, and found defects which were not there in 1890. There were cracks across three piers on the south side, and it was obvious that some movement had taken place since October 1890. The buttresses would arrest this movement to a certain extent, but he should make them stronger still. He did not consider it was a perfect building, and in his opinion the buttresses were necessary, and had done good.

In reply to Mr. Bailhache witness said that the foundations were not very soft, and he knew of softer ones. They would stand any weight if there was sufficient base. He tested the buttresses on the south side, and they were practically plumb, as was also one he tested on the north side. He should not like to be a performer on the trapeze in the building, because the reaction on one of the ribs when a performer let go one

trapeze to catch another would be tremendous. The cracks in the walls he thought were due to wind-pressure.

Mr. Hornby mentioned that there was no trapeze in the building; they did not put them up. There were rings there, but rings were very different to trapezes.

In reply to further questions from Mr. Bailhache, witness said there would be some amount of vibration caused by the rings, and had he been consulted he would not have recommended that they should be erected. There was not sufficient space on the north side to put up a flying buttress.

In re-examination Mr. Rees said that the buttresses erected would give more support than flying buttresses.

Mr. Marsh, C.E., a partner in the Isca Foundry, stated that his firm constructed roofs for the War Department and for foreign governments. He was requested to inspect the gymnasium when it was handed over by the contractor. He found no difficulty in discovering the defects in it, as they were obvious. In July 1892 he was casually in the building, and saw several cracks in the piers, which had taken place since his first report. These were caused by the thrust of the ribs outwards. Had the ribs been properly constructed there should not have been outward thrust of the walls, as they were constructed on what was known as the continuous principle. The ribs were very much distorted, which proved that they were incapable of carrying the weight upon them. He thought that the buttresses which had been erected were the best remedy that could be devised.

Mr. Benjamin Lawrence, architect, said that in certain places the walls were considerably out of the perpendicular, and there were cracks in the walls. In his opinion the buttress materially strengthened the building.

Mr. C. Miles said on January 25 he attended the gymnasium buildings with Mr. Lawrence. He agreed generally with the latter's evidence as to the state of the building, as to the work done, and as to the effect of the buttresses.

This concluded the case for the plaintiff.

Mr. Bailhache, for the defence, stated that the defendant took over the work of finishing a building which for some reason was in danger of coming down, and had "sagged" out. What the defendant had to do was to do the best he could under the circumstances, and to follow the plans as far as he could. The only deviations from the original plans were the tie rods.

His Honour: You say the buttresses were of no use?

Mr. Bailhache: We say they were not wanted. They have

sunk since they were put in, and in "sagging" they drew out the walls to some slight extent.

Mr. T. E. Watkins, the defendant, stated that he alone carried on the business covered by the present transactions. In March 1890 he entered into an agreement with Mr. Phillips and Mr. Bellerby, upon which the present action was brought. Describing the work, witness said he stripped the roof, and put four tie-rods across from the hammer-beams. The north wall was 7 inches out of plumb, and the south wall from 3 to 5 inches. He screwed as far as he considered safe. Then the north wall was 2 inches only out, while the south was practically plumb. In September 1890 he notified the committee that the building was finished under the agreement. Subsequently some of the committee and he went over the building, and they expressed their satisfaction with the building, with the exception of a few trivial things which he put right. He was paid for the work. In October 1892 he received a letter from Mr. Mark Phillips stating that there were several serious defects in the building, and that the committee desired to call his attention to it. He (witness) made a careful inspection, but did not find any indication of any hitches in the building. It was exactly as when he left it. The cracks in the top piers were not serious. These were due simply to screwing up the tie-rods, not from outside thrusting. In April last he made an inspection, and he then found a distinct move under the hammer-beam. The walls had given, and he noticed this for the first time after the buttresses were built. The buttresses pulled the walls over. The foundations under the buttresses were very poor.

Replying to Mr. Hornby, witness said that under the new agreement he regarded himself as the builder and not the architect for the club. The ribs, although not true, were strong enough for the weight they were intended to carry. There was no indication that the buttresses had torn away from the walls, but the wall and buttress had moved together.

William Eynon, a master carpenter, said that when the building collapsed the walls were pulled up until they began to crack. He saw them last October, and there was no difference in them from when they were completed.

The court then adjourned.

On the second day Mr. Hornby, before proceeding, asked his Honour to allow him to tender Mr. T. D. Roberts in evidence, as he was called away.

Mr. T. D. Roberts, district engineer for the G.W.R., said that in October 1890, at the request of the club he inspected

the gymnasium, and presented a report. He visited the building about ten days ago. He found an indication of a movement of the walls near the principal. There were no such indications when he examined the building before. The wall was only 14 inches in thickness, and by the movement of the roof it had been strained and fractured.

His Honour inquired if Mr. Roberts considered it a safe building.

Mr. Roberts: I am sure it is not a building that I would put up as a safe building. I do not wish to criticise the architect, but I do not consider it a safe and sound building. The buttresses are in my opinion the best thing that could have been done under the circumstances in order to keep the walls up.

His Honour asked if the buttresses had fallen away from the brick walls.

Mr. Roberts: I have examined the walls, and can't see any indication of that.

His Honour: I have looked at them myself, and can't find any indication.

In answer to another question, Mr. Roberts said he did not think it was possible that the erection of the buttresses could have been caused by the movement of the roof.

After Mr. Bailhache had cross-examined the witness at length, the examination of witnesses for the defence was resumed.

Mr. Robert Pickwell, architect, Cardiff, said he examined the gymnasium on May 6 and 11. He explained the nature of the pressure of the roof, and said there was no outward pressure below the tie rods. The buttresses did not make the slightest difference to the stability of the building, and if the gymnasium was his he should not have the slightest hesitation in removing them. He did not think the buttresses were necessary, but considered it a great mistake to put them there. The buttresses on the north side were about an inch out of plumb. The buttresses had not broken away from the walls, but had taken the walls with them. Witness further said that the buttresses did more harm than good. They never had any business to be put there. He thought the pine-end wall was of sufficient thickness. Replying to his Honour, he said it was a fallacy to think that the roof was not strong enough for trapeze performances. It was like a fly on an elephant's back.

Mr. A. O. Watkins was the next witness. He stated that the cracks in the building were caused by the process of

drawing the walls together. When the work was done the walls were whitewashed over. As cracks they were very small. They showed more now than before as the dirt had got into them. The cracks had not got any worse. Blue clay foundations were one of the worst obtainable, and necessitated elaborate precautions as to the artificial foundations. He should expect a settlement in new work.

Cross-examined: When the original building was put up it was expected to settle. As to the cracks spoken of, new ones could not be discerned so quickly as old ones.

Mr. E. H. Bruton, architect (Cardiff), deposed that he went over the gymnasium. Generally speaking, he agreed with Mr. Pickwell's evidence. He believed the cracks, being on the top of the wall, did not affect the building at all.

His Honour: Not if they go through the wall?

Witness: Not even then. He had frequently found cracks in slight walls like this. He thought the building before the buttresses were put up was safe.

His Honour: Would you like to perform on the trapeze?

Witness replied that he would not object. The trapeze could not have any real effect on the stability of the structure.

Cross-examined: The collapse showed a distinct weakness somewhere. (The witness fainted while in the witness box, and was shortly afterwards removed from the court.)

Mr. Dyne Steel stated that he made an examination of the gymnasium quite recently. The building, apart from the buttresses, was safe and proper.

Cross-examined: The building must have been weak or it would not have collapsed. He did not call it a weak roof. The weak part were the walls between the piers.

Mr. S. W. Allen (engineer), Cardiff, stated that the buttresses were quite unnecessary.

Mr. J. D. Whittaker (Newport) deposed that the building of the buttresses would account for the slips in the wall. He saw some cracks in the top of the wall, but they were of no serious consequence. As to the buttresses, even if they were required they were wrongly constructed.

Cross-examined: The committee of the club were badly advised. The buttresses were worse than useless; they did harm. With reference to the cracks, there were very few buildings without them.

Mr. Bailhache then addressed the Court. He urged that the club sought to put on Mr. Watkins all sorts of liabilities which he never undertook by the agreement of March 21, 1890. Mr. Watkins was being pressed more than he ought to be. Mr.

KALLKOLITH.

NEW PATENT PRIMING AND STAIN.

Acknowledged by experts of nearly every country to be one of the most important inventions of the Nineteenth Century.

PATENTED IN
England,
Belgium,
France,
Germany,
Italy.

PATENTED IN
Austria-
Hungary,
Denmark,
United
States
of America.

KALLKOLITH is one of the most marvellous inventions of the present age, and is used as a priming in place of the now almost obsolete oil-colour. It produces an exquisite smoothness, combined with great durability, and amalgamates thoroughly with wood, iron, cement, stone, plastering, &c.

CHEAPNESS.—It saves at least 100 per cent. in comparison with any other priming now in use, being less than half the weight.

ECONOMY is manifested by the fact that one 14-lb. tin of **KALLKOLITH** goes further than three times the same quantity of oil-colour.

DRYING POWERS.—It dries within one to two hours, thereby greatly facilitating the quick dispatch of labour.

DURABILITY.—Where **KALLKOLITH** is used it imparts an amount of durability to all oil-colours used upon it which has never yet been obtained, and one of the most important advantage in its use is that the paint put upon it does not blister.

PAPER-HANGING.—Walls prepared with **KALLKOLITH**, thinned with seven parts of water, give a great additional advantage to the hanging of all descriptions of papers.

TESTIMONIALS.

21 New Bridge Street, London, E.C.: February 23, 1886.
I have had some trials made with the **KALLKOLITH** during the past few weeks, the results of which are very satisfactory. The **KALLKOLITH** is to be used as the first coat of paint on wood and other substances, and is of such a nature that the ordinary work in preparing for paint is considerably lessened, and the usual number of given coats now reduced, and, once fairly introduced in the market, I am certain there will be a large sale.
J. W. M. STEVENS, Architect and Surveyor.

75 Newman Street, Oxford Street, W.: Feb. 15, 1887.
We are pleased to tell you that the **KALLKOLITH** supplied to us has been fairly tried, and we find that it answers all that you claim for it.
CAMPBELL, SMITH & CO.

Price per case of 8 Tins of 14 lbs. each, net 40s., packing included. Special terms to Wholesale Buyers and Shippers.

Address—E. STUTTARD, 88 ADELAIDE ROAD, BROCKLEY, LONDON, S.E.

Watkins had absolutely discharged his liabilities under the agreement. The only structural defect to consider was as to whether the walls had bulged out since the building was handed over. The walls did not go out until the buttresses were put down.

Mr. Hornby submitted that if his Honour was satisfied that when defendant handed over the building there was any defect, there was a breach of the contract. Assuming that there were defects, the plaintiffs were bound to do something to remedy the defects. This being done, the defendant was liable.

His Honour, in giving judgment, said that if a man gave a contract to have a house built he was entitled to have the walls straight, and no cracks in them. The defects in the walls were in existence before the buttresses were erected. Upon the whole of the evidence he thought the plaintiff was entitled to recover. He gave judgment for 60% and the usual costs.

AMERICAN BUILDERS.

THE seventh convention of the National Association of Builders of the United States has been held at St. Louis, Missouri, under the presidency of Mr. Alexander Ittner, of St. Louis. In the course of his address, he said :—

Our association is now assembled in seventh annual convention ; Chicago, Cincinnati, Philadelphia, St. Paul, New York, Cleveland, and now St. Louis, in the order named, are the cities that have been successively honoured by your presence. It is my pleasant privilege to speak in a general way of some of the good things accomplished since the organisation of our association. There cannot now be any question among well-informed and unprejudiced persons concerning the foresight and wisdom of its founders. To question proper and intelligent organisation and co-operation among those in any line of calling, whose interests are kindred and mutual in their nature, can only be accounted for through ignorance or prejudice, as, to do so, is to call into question the very fundamental principles upon which society and our government are founded. Our methods are open, manly and just, we transact our business with open doors, in the full light of the noonday sun, and our proceedings are recorded and printed in full, so that they can be witnessed and read by all who may have a desire to do so—in fact, we take special pleasure in furnishing any information that may be desired concerning our organisation to anyone who may apply for same.

The results of our deliberations are merely recommendatory, and are submitted to the filial bodies composing this association and to the trade generally, in order to bring about uniformity of methods and practices with a view to the general betterment and well being of all concerned, and for the purpose of creating and perpetuating a proper and friendly feeling between employer and employe. It is in no self-laudatory spirit, but rather as a fact, that I assert that no man who has witnessed our proceedings and the personnel of our membership can go away without being favourably impressed with both, and I presage for our association length of days and a great future that must ultimately place it in the fore-front of national bodies ; in fact, I go further, and predict the day (perhaps not in our time), when we shall assume an international character by meeting in joint assembly the brightest minds of the old world and exchanging with them ideas of the greatest benefit to both hemispheres ; and in this way enlarge the scope of our usefulness. I am in such full sympathy and hearty accord with many of the principles enunciated by our association at its first annual convention in Chicago, that I hope to be pardoned for reproducing some of them and making them part of my address.

In your Declaration of Rights you say :—" This association affirms that absolute personal independence of the individual to work or not to work, to employ or not to employ, is a fundamental principle which should never be questioned or assailed ; that upon it depends the security of our whole social fabric and business prosperity, and that employers and workmen should be equally interested in its defence and preservation. While upholding this principle as an essential safeguard for all concerned, this association would appeal to employers in building trades to recognise that there are many opportunities for good in associations of workmen ; and, while condemning and opposing improper action upon their part, they should aid and assist them in all just and honourable purposes. That while, upon fundamental principles, it would be useless to confer or arbitrate, there are still many points upon which conferences and arbitrations are perfectly right and proper, and that upon such points it is a manifest duty to take advantage of the opportunities afforded by associations to confer together, to the end that strikes, lock-outs and other disturbances may be prevented. When such conferences are entered into, care should be taken to state clearly, in advance, that this fundamental principle must be maintained, and that such conferences should only be competent to report results in the form of resolutions

of recommendation to the individuals composing the various organisations participating, avoiding all forms of dictatorial authority." This reads well, and after a lapse of six years, I take it, there is nothing contained therein that you would care to modify or expunge, nay, on the contrary, every word and syllable it expresses is something to be proud of and you may well congratulate yourselves that such is the record.

I now ask your attention to the leading paragraph in your Constitution, which you will agree with me dovetails nicely with the paragraph just read from your Declaration of Rights. It is as follows:—

"Article II.—The fundamental objects of this association shall be to foster and protect the interests of contractors, workmen, and others concerned in the erection and construction of buildings; to promote mechanical and industrial interests; to acquire, preserve and disseminate valuable information connected with building trades; to devise and suggest plans for the preservation of mechanical skill through a more complete and practical apprenticeship system; and to establish uniformity and harmony of action among builders throughout the country. The better to accomplish these objects this association shall encourage the establishment of Builders' Exchanges in every city or town of importance throughout the country, and shall aid them to organise upon some general system that will not conflict with local customs and interests, in order that through these filial associations the resolutions and recommendations of this National Association may be promulgated and adopted in all localities."

I trust you will agree with me that the magnitude and importance of these fundamental principles and declarations of your national body were sufficient justification for their repetition as a part of my address; thereby hoping to familiarise the public more and more with our objects and purposes, and in this way to secure the approbation and esteem of the people of our common country, and at the same time to increase our usefulness and importance.

There were also recommended at your first Convention "the adoption of a uniform system of apprenticeship by the various mechanical trades;" "that manual training schools should be established as a part of the public school system, and that trade night schools should be organised by the various local trade organisations, for the benefit and improvement of apprentices;" also a system of payment by the hour for all labour performed, other than "piece" and "salary work." A uniform contract was recommended, which has since been

adopted, and is now generally used throughout the country. This was brought about through a joint committee of the American Institute of Architects, the Western Association of Architects and of the National Association of Builders. Since your last Convention at Cleveland, Ohio, this contract has been amended, and will be submitted to you in its present shape by your committee, of which Mr. George C. Prussing, of Chicago, is chairman.

On the subject of trade schools and apprenticeships we have great cause for congratulation. Colonel R. T. Auchmuty, of New York, who is the pioneer of trade schools in this country, has been encouraged in his good work by a munificent voluntary gift of a half million dollars by J. Pierpont Morgan of New York. When we consider how deeply Colonel Auchmuty's heart is engaged in this work, and that his remaining days are dedicated to its service and advancement, we can appreciate the feeling of gladness and rejoicing that possessed his very being when the knowledge first came to him of this princely gift. Colonel Auchmuty came to me in our convention hall in New York, having learned that we were then agitating the establishment of a trade school in our city, under the auspices of our Exchange, and voluntarily offered a contribution of 1,500 dols. a year for three years, in case we should succeed in starting a trade school here. I thanked the colonel from the bottom of my heart for his generous offer, and knowing what he was then doing for the Philadelphia Trade School, and the great responsibility he had on his hands in his own school, which I understood was being maintained entirely at his own expense, I remarked to him that he was doing himself an injustice; that the impulses of his big heart would lead him to take upon himself a greater load than he could carry. His answer to this was, "Mr. Ittner, I have not got many years to live and I desire that the remainder of my days shall be spent in the interest of the 'American boy.'" All honour to Colonel Richard T. Auchmuty, of New York. I desire to say in this connection that I felt it a duty incumbent upon me to write to J. Pierpont Morgan, of New York, thanking him on behalf of the National Association of Builders and in the interest of the "American boy" for his noble gift in aid of Colonel Auchmuty's Trade School, and I feel sure that you will approve and endorse that action. We still receive very flattering and encouraging reports from the trade school established under the auspices of the Builders' Exchange of Philadelphia. I regret to be compelled to report that as yet nothing definite has been done toward the establishment of a

trade school in this city, but I feel justified in saying that the project is not abandoned by any means; there are those among us who, with half encouragement, will take it up and inaugurate the system, and, once under way, I have no fear of its final success.

It affords me much pleasure to be able to report for the information of the Convention that a system of apprenticeships, or miniature trade schools, has been in vogue for some time in this country, in other than the building trades, principally in iron foundries, in the stove and hollow ware moulding business. I have letters from those who have the system in successful operation, which I would be glad to present to the Convention should the discussion upon this subject during your deliberations call them out. I hope and pray for the day to come when no "American boy," with the spirit and ambition within him to advance his condition and become a skilled workman, will be debarred the privilege of doing so. As well might we shut out the sunlight of heaven, and withhold the air and water from a portion of God's children, as to place arbitrary restrictions upon a portion of the same family, that would debar them from becoming skilled artisans. There will always be drones enough from choice, or I might say from want of ambition or desire to advance in the world, and from untoward circumstances, to do the drudgery. This class is at present largely in the majority, or unskilled labour would not be working to-day for one-half and in many cases for one-fourth, and in rare instances for one-tenth of what is being paid to skilled labour. There is no just reason to be advanced why the difference should be so great.

There is a dearth of skilled labour in all branches of industry, largely if not altogether due to the proscription of the apprenticeship system by the organised labour associations of the country. Having laboured from boyhood, and having served and had the advantages of an apprenticeship in two different trades, I have the greater reason to sympathise with those who are so unfortunate as to be debarred the advantages of any trade at all. There is also a feeling of disappointment in the contemplation of the thought that free American mechanics, in a free country, should encourage restrictive and arbitrary rules by which American boys are deprived of the advantages of trades and of becoming skilled workmen. There is a sadness in the reflection that a father would favour methods by which his own son is prevented from learning the trade of his choice. The wrong would indeed be deplorable if there were not an outcome resulting in good, in the shape of the trade school and

which will ere long supply the want, and also mark a vast improvement on the old system.

Mr. President Tucker, at our fifth Convention in New York, made brief mention concerning a subject that is receiving more or less attention from the business world. I refer to profit-sharing, which I deem of sufficient importance and merit for your careful consideration, and would recommend that the matter be entertained and sent to one of your standing committees, or, if you think best, have it go to a special committee; also that more full and accurate statistics be encouraged, by and through the filial bodies composing this association, so that we may be enabled to arrive at a more complete knowledge of the vastness and importance of the building industry in this country; likewise to encourage through the same channel perfect building laws and ordinances governing the proper construction of buildings in cities, where such do not now exist, and that experienced and competent practical builders be selected as commissioners to supervise their construction. It is to be hoped that the uniform style of contract, as revised and amended during the year, will now come into more general use, and that many wrongs and inequalities, so aptly referred to in President McAllister's last annual address, heretofore imposed upon the contracting builders, will cease. The relations existing between the architect and the builder should be friendly and sincere in their nature. The former can do full justice to his client without necessarily doing an injury to the builder, and in case the builder renders an honest compliance with the terms of his contract, he should not be asked to do more.

Such magnificent exhibitions of skill and speed would astonish the builders of old, could they, after the lapse of centuries, come forth from their grave and view these grand structures. They would surely stand spellbound with wonder and awe at the mighty progress and skill of the builder of to-day (as compared with the time in which they "lived and moved and had their being"). Nor has the state of the art, as yet, by any means reached perfection. Arguing from the history and experience of the past, we are justified in the conclusion that it is susceptible of still greater improvement.

Architecture in this country, as it is to be seen and admired at the World's Columbian Exposition in Chicago, has reached its most advanced state, and, as one having had the privilege of witnessing its beauty and grandeur on the occasion of the formal opening in October last, I feel justified in saying that it does great honour to the profession, and my sincere wish is

VOLUME XLVIII. OF THE ARCHITECT.
Handsomely bound in cloth, gilt lettered.

Price 12s. 6d. Office: 175 Strand, London, W.C.

that every American citizen, with any taste for art and love of the beautiful, might have the opportunity to view the beauty of outline of the many buildings within the World's Fair enclosure.

It is, indeed, with a sad heart that I announce the death, during the past year, of Marc Eidlitz, of New York, one of the charter members of our association, and a man whom to know was to respect and honour, and whose person and presence gave tone and dignity to any body of which he was a member. So far as I am at present aware, the only solemn and painful duty you will be called on to perform during this session is to formulate appropriate resolutions of respect to his memory.

While it is our wish to have this, the seventh annual Convention, known as a business meeting, it is not our purpose to depart from or omit any of the pleasant customs and enjoyments that have uniformly been observed on previous occasions of this sort, and which serve to make us better acquainted with each other, and thus increase our advantages and usefulness as members of the association.

While, as I am disposed to believe, we may have plenty of work to do in the consideration of propositions suggested at previous Conventions, we will still be glad to receive new thoughts and matters to be acted upon at the present session, if the time will permit, or to be submitted and referred to appropriate committees to be reported and acted upon at a future meeting.

The World's Columbian Exposition at Chicago marks unparalleled advancement in architecture and building compared with its status as exhibited at the Centennial Exposition at Philadelphia in 1876.

I think it is no stretch of the imagination to say the progress made in the intervening seventeen years far exceeds the progress of our entire previous history as a nation.

No one who has not heretofore or who may not hereafter visit the Exposition, and witness with his own eyes the magnitude and grandeur of the graceful and stately structures that there meet the eye on every hand, can possibly credit my statement, and it is upon this account that I urge upon every American citizen who loves his country and prides himself upon its advancement and glory, to spend his last dollar if necessary, even to pawning his watch, if he has one, in order to raise the money to visit the World's Fair and behold its beauties. The time will be profitably spent, and he who goes will thereafter feel himself more a man and cherish a stronger

feeling of pride for his country and its citizenship. Yes, by all means, and under any and all circumstances, let everyone who can visit Chicago, and cross the threshold of a new world in science, art and manufactures. I trust I may be excused for the further reference to this subject, but I feel its importance sufficient justification.

PATENTS.

[This List of Patents is compiled specially for this Journal by Mr. G. H. Rayner, of the firm of Rayner & Co., Consulting Patent Agents, 37 Chancery Lane, London, W.C. from whom all particulars and information relating to Patents may be had gratuitously.]

APPLICATIONS FOR PATENTS.

9144. William Kincaid and Arthur Heaton, for "Window-sash regulator for all kinds of windows, either railway carriage or house, also acts as burglar alarm."

school building from the standpoint of an architect and a sanitarian, giving also some of the prevailing opinions on the subject. In the olden time, and in the warm countries where teachers and scholars first assembled, school buildings were of minor importance. The transmission of ideas from teacher to pupil, education itself, pure and simple, was the chief occupation.

Let it not be understood that there was little done in education during the centuries that just preceded the dawn of the modern era. Passing over the work done by the ancient Oriental, Greek and Roman nations, we may briefly say that the European nations, from the eleventh century onward, possessed tens of thousands of earnest teachers and scholars. From this date hundreds of universities, with their colleges and academies, came into being, and the characters of the learned and great were there moulded.

The revival of learning, beginning in the eleventh century, continued in an increasing proportion through the Middle Ages, and is increasing still faster to-day.

In the fifteenth century, when the Renaissance of learning had become almost universal, there were as many as 30,000 students in one university, that of Paris, and there were proportionately large numbers at many other universities of the time.

At first there were no common schools, the rich and the noble only being able to get an education.

Organisation, and especially Government control, were not marked features of the earlier institutions. The first school was simple and instructed in but a few subjects. Later came academies, then colleges, then groups of colleges called universities.

For a long period there was much groping in darkness, and it remained for the present century to perfect organisation, combine conflicting interests and approach more nearly to that harmonious and effective union that shall eventually bring about the education of the world.

The number of persons who have come under the influence of educational facilities since the eleventh century is incredibly large, tens of millions and more, and of course it is evident that the mental quality of these persons is far above the average. It may be said that they represent the cream of the earth. They are the ones that have moulded the world's thought, are doing it to-day and always will do it.

It is an unfortunate circumstance that those so valuable in the world, those whose bodily strength and mental vigour are

so necessary to the world's welfare, should have acquired their education, should have been fitted for their life work amid surroundings so ill-adapted to the preservation of bodily health.

The purpose of a good school building is to preserve and enhance the bodily health of the student, while he endures the fatigues of study; but alas! for the health of the students that have gone before. School buildings there were, sanitary they were not, and many a student paid for this lack with his life.

Of course, it should be our duty to see that this lack no longer exists. Along with the rest of our knowledge we should know the essential facts about school sanitation. It is needless to say that we are not fully awake to the requirements, and notwithstanding the fact that our predecessors have suffered so severely, thousands of students to-day are paying the penalty of ignorance or carelessness on matters of sanitation, sometimes with impaired health, sometimes with life itself.

More than that, thousands of children who are not old enough to know what is killing them are allowed to inhabit unsanitary school buildings. The consequences of this last evil are far-reaching, and, like most modern evils, this one is hard to overcome, because we are apt to fancy that such things cannot exist in the nineteenth century.

Years ago children did not go to school and adult students were better able to stand bad sanitation; but now millions of children are cooped in close schoolrooms without proper air and amid other unsanitary surroundings.

Few know the awful extent of this evil, and few are willing to know it. However that may be, it is a fact that a greater number of students, old and young, are being sacrificed to bad sanitation than ever before, in spite of the ignorance of our ancestors. Further, the confinement of our young students in such a way is surely and rapidly telling on the general vigour of the nation. Nor is this to our shame, since it is quite possible, at reasonable cost, to build school buildings that shall be practically perfect in point of sanitation. True, there is no school building yet devised that contains all the good things, and there are many points still under discussion by intelligent engineers.

As to the requirements of a sanitary school building and one best suited to the needs of children, say a common school of twenty rooms: First, it should be as nearly fireproof as practicable. Children do not have the strength and experience of adults and cannot look out for themselves. If it cannot be

fireproof reduce the fire risk as much as possible. Wooden partitions, though often used, should be avoided. If outer walls are furred it should be done with fireproof furring. Stairs should be enclosed in brick shafts, and the stairs themselves made of solid material, preferably of hard wood for both risers and treads, with fireproof or slow-burning construction underneath them. If floors are of wood on wooden joists, as they generally must be, the spaces between the joists should be cut off with solid plank in addition to the usual bridging. On no account should the floors be raised from the joists for the purpose of circulating air underneath unless all parts are fireproof. Floors should be of good smooth hard wood, closely laid on an under floor, and deadened with mineral wool or something as good. Joists should not run through from wall to wall, and should be so placed as to drop out without tearing the wall in case of fire. The danger from fire can be considerably lessened by judicious planning, so that all rooms are easily accessible to the halls and the stairs. All exits should be so plainly indicated that a stranger would have no trouble in choosing them at once.

The sanitary school building should be well lighted. This matter has received considerable attention from scientific men. It is claimed that an ideal system would bring in the light from the top of the room and distribute it equally throughout. Many object to this because it appears prison-like; besides in a building with one room over another it is impracticable. Schoolrooms being generally lighted from side windows it becomes a question as to number and location. It is conceded that the light should enter as near the ceiling as possible, therefore windows reach to the ceiling or nearly so.

It has been customary to follow the rule that light should come over the left shoulder, so as to avoid a shadow on the desk from the right hand; but while this is a good rule it is found hard to apply it where several pupils are together, as in a schoolroom, since that which will be left-shoulder light for one pupil will not be for some other. In practice an average is struck, and the windows so placed as to properly accommodate the greatest number. With windows on one side only about one-half the pupils get the left-shoulder light in some degree when they sit with the left side to the windows. The other half gets the light chiefly in the left eye, or more in the left than in the right. That is a bad arrangement and prolific of unequal vision. This can in some degree be lessened by placing the side windows well toward the rear, and placing some on the rear as well. There is then, however, the objec-

tion that the pupils in the diagonal corner furthest from the light are too much in the dark.

In a room lighted wholly from one side and the pupils placed with back to the light some curious facts are noticeable. First, the same number of pupils receive left-shoulder light, as in the former case—that is, one-half; the other half receives the light over the right shoulder, not a desirable thing and not to be tolerated unless there is enough reflected light to dissipate the shadow cast by the right hand on the desk. If there can be such reflected light, and there is no doubt about that, it gives the best light I know of for so many pupils, since as many get left-shoulder light as in the other way, and none of them get it partly in front. That this is the best arrangement for the pupils I think there can be no question, though upon the teacher it is especially hard, though it may be said that the teacher can always move about, while the pupils must stay where they are.

I think it is common to put some windows on the side and some on the end of each room, where it can be done, though I am inclined to think the side light the better, if it could be properly curtained and managed by the teacher. Whatever the position of windows there should be plenty of them.

The sanitary school building must be well heated and ventilated. These two things can be considered together, though heating alone used to be the first and only consideration. The requirements call for the right amount of fresh air and heat, properly introduced to the rooms and circulated therein. Economy seems to call for a central plant for the supply. One of the main difficulties to overcome after a good heating device has been provided is the proper inlet, exit and circulation of the ventilating air in the schoolroom. Unless this work be properly done the whole plant is a failure, and it is a fact that much confusion exists as to the method to be employed. The problem is made more difficult of solution because the atmospheric changes are so rapid and radical that no single arrangement of the working parts will answer for any certain time. Obviously the best way to have the air enter a schoolroom would be at openings all over the floor, and it should leave at a like number of openings in the ceiling. That way is not practicable where rooms are over one another, and therefore the common way of introducing air into the room is by a single and ample opening. It is let out by another. Where these inlets and outlets shall be placed with reference to each other and the room itself is a question in dispute. Much confusion obtains on this point—perhaps because people

believe it is possible to adjust the openings to suit all occasions. The question will be much nearer solution when this belief is eradicated. In some rooms the inlet will be found at the top and the outlet at the bottom; in others it will be the reverse. In some there will be inlets and outlets at both top and bottom; in others the inlet and outlet on the same side of the room. In others the inlet will be on one side and the outlet on the other.

Probably there will be confusion on this point so long as the single inlets and outlets are used.

We must have circulation through the room, and we get it in one of two ways. Either the air may enter cooler than the room, in which case, if the inlet is at the bottom and the outlet at the top, a fair circulation will be given; or the air may enter warmer than the room, when, if the inlet is at the top and the outlet at the bottom, a good circulation will be got.

Since it is a fact that air must sometimes enter warm and sometimes cool, so as to maintain the standard of heat, it will be seen that neither arrangement of openings will answer for both cases, and the working parts cannot be so fixed as to give perfect satisfaction. If both inlets and outlets are provided at top and bottom when cool air is wanted, the floor inlet and the ceiling outlet can be used. When warm air is wanted the ceiling inlet and floor outlet can be used. But aside from the difficulty of getting any one to understand it, it would take one person's time to watch the thermometer and manage the dampers. Present practice largely adopts the ceiling inlet and floor outlet, ignoring the fact that incoming cool air falls to the floor, and poor circulation is the result.

This intermittent lack of circulation is a grave difficulty and hard or impossible to be avoided when the inlet is high and the outlet low, more especially when a room is heated by air alone.

Some engineers try to prevent notice being taken of the difficulty by putting the inlet at or near the floor. When the air comes in warm it rises to the ceiling, distributes, cools and falls to the floor, leaving at the foul-air opening. Under these conditions the air appears to circulate properly, the only objection being a current of hot air striking the pupils. This current of air is made less noticeable by a screen; that is, of course, unnecessary when the inlet is above. On the other hand, with the inlet at the floor and the air coming in cool, there is and can be little or no circulation through the room, the air simply entering, flowing along the floor, and leaving at the outlet. This seems to be a case of out of sight and notice, out of

mind. The lack of ventilation is not easily discovered, and thus gives a fine chance for the professional quack to show off his system of ventilation, for with his air meter at the inlet and the outlet he finds the full volume of air passing that he guaranteed to furnish, and no one stops to inquire whether that air gets to the proper parts of the room by circulation.

I believe it would be a good system to heat the floors evenly and always bring the air in cool, provided that the floor heat could be controlled and unpleasant draughts prevented.

It is hard to say where the inlets and outlets should be placed to satisfy all conditions, but I have advocated putting the inlet high and the outlet low, though I am quite ready to change should a better way be found.

The general plant that is to furnish the heat and ventilation in a sanitary school building must be ample to do its work. It must be durable, cheap to put in and cheap to maintain. Furnaces furnishing hot air, steam plants and hot water plants, with numerous modifications and partial unions, are the principal kinds used in school buildings. For years the furnace did good duty, and it still holds its place, at least in the smaller class of buildings. Its first office was probably that of heating, though it was made so that it had to furnish ventilation in order to heat. When steam first came into use its work was entirely that of heating, and for a time schools heated by steam were a long way behind those heated by furnaces. Necessity soon compelled the use of indirect radiators to heat air for ventilation. This system had quite a run, and is still used, though it gradually loses favour as better methods come up.

The marked advance in ventilation during the last few years has been the adoption of a fan or fans run by power for sending the air to the rooms. In furnace-heated buildings the only method of creating suitable currents was by heat, and in order to induce currents in the foul-air shaft it was connected with the smoke-stack, the heat of which caused the current. In steam-heated buildings coils were used in addition to the smoke-stack. It has been recently discovered, however, that the heat used to create currents in the foul-air shaft would be of more service in running a fan to do the same work. Hence fans are in common use. There is a difference of opinion whether one fan or two shall be used. I am of the opinion that with our ordinary leaky rooms two do the work better than one, though there is room for argument on that point.

From the old form of steam plant have sprung many

modifications. There is one that heats entirely by steam coils placed in a fresh-air room in the basement, the air being blown to the rooms by a fan. At present I favour the adoption of a central steam plant, running direct radiators to the rooms, an indirect set of radiators to heat the fresh air, a fan to blow it into the rooms and an exhaust fan to take it out. In a cold climate it works well; in fact, I do not see how it would be possible to get so good results from any other method. In warmer places than Minnesota I suppose the hot-air system would be sufficient.

This steam system has its faults and can be much improved, especially as regards details of arrangement. While being somewhat more costly to put in than the indirect method, it makes a very low record for fuel, a good point in any plant. Contrary to expectation, it has been found cheaper to run and fully ventilate than to run the old steam plants without ventilation. It was said when fans came into use, and talk of 1,200 cubic feet of fresh air per hour per pupil was made, that it might be very well and quite necessary that we have this fan ventilation, no matter what it cost for fuel. That the fuel bill would be increased no one doubted; nevertheless, it has decreased, and this fact should be a strong argument for its adoption over the country.

The sanitary school building must properly dispose of its waste. I declare for first-class plumbing, without hesitation, where sewerage connection can be had. Where it cannot be had and cesspools are impracticable, I am not so certain what to say. There is a choice among dry closets, crematories and out-of-door privies. As to plumbing, it has been often and justly condemned. It has been the cause of much sickness and death. Whatever it has been, the day has come when a plumbing job can be made practically perfect, so that it can be fully recommended for any kind of building. In our modern school building nothing can be better than our best known water-closets, with slate or glass urinals.

However, there are schools where plumbing cannot well be had. There seems to be demand that all toilet-rooms shall be inside the building. This demand I believe to be just, provided the inside toilet-rooms can be made quite sanitary; the demand ought to be complied with. But here is the difficulty. The problem seems nearer solution than it did years ago, but there has been great injustice done in the attempt to get a safe device. The principle of the dry closet and the crematory is either to dry or burn the sewage. There has been a dry closet in use more or less where the privy vaults were in the base-

ment but wholly unconnected with any other part of the building. This seems to have met with fair success, at least in that it does not admit odours to the schoolrooms, but it costs a large amount for fuel and has no great run.

There is another dry closet in which the privy vaults are connected with the schoolrooms by means of hollow wooden floors and partitions, though sometimes this connection is made through direct ducts. This bold step was evidently taken to save fuel, and though the whole device was carefully arranged and it possesses many taking points, I believe it is inevitably doomed to condemnation as an unsanitary device. No privy vaults connected directly or indirectly with the schoolrooms ought to be upheld for a moment, for, although the draught may be made to go the right way some of the time, it will occasionally back up from the privies into the rooms, and no such thing should be tolerated. If outside privies could not be used it would be better for a scavenger to stand at the basement door with a cart and remove the contents of vaults daily or hourly, than for the public to tolerate such a thing. Happily there is a strong sentiment against this device, and attention is being wisely turned to more sanitary contrivances.

Along this line it may be well to say that the recent crematory closet seems to be somewhat in advance of the old dry closet. It has at least the merit of not being connected with the rooms, so what odour there is, not going up the stack provided for it, is not likely to get into the rooms. I have not seen the crematory closet tried, but it seems to promise well. The only difficulty I can foresee is in the disposal of the urine, which will accumulate in unpleasant quantities unless the greatest care is taken. It has been suggested that outdoor privies be used, warmed if need be; but the need of personal control while the children are in the toilet-rooms by janitor and teacher is a strong argument in favour of the inside safe closet, if such can be found.

There are numerous other points that could be touched upon in the sanitation of a good school building, and the ones on which I have dwelt could be handled more effectively. I have spoken of things that do not come within the present scope of the duties of a building inspector. The subject of school buildings is not a new one to me, for I began the investigation long before I left the ranks as building inspector of Minneapolis. At that time I had it in mind to enlarge the duties of the office, so that it should include the oversight of public school buildings as regards all the points mentioned, and I here take the opportunity to entreat you as a body that

you will use your best efforts to get the public school buildings of your various cities under the control of your office in so far as relates to sanitary requirements.

School sanitation is far too loosely managed now, and there are far too many selfish interests at work that ride rough-shod over the rights of the school population. To-day our schools are the prey of unscrupulous heating and ventilation quacks. Boards of education, well-meaning enough in their way, are their dupes. Understand me as saying there are many honest and competent heating engineers, but we need protection from the dishonest ones. In fact, in a matter that means everything to our children and posterity, some competent body should have control. Such a body would justly bar out every man whose system is not the best to be had. Remember that this is not a question of who makes the best presentation of his system, but who has the best. At present there seems to be no competent body that has authority to investigate and pass judgment in these matters. Why should not the cities take up the matter through the inspectors of buildings?

I fancy I can see why this association is peculiarly fitted for the work to meet in annual convention. We discuss things of general and particular interest. This body has less temptation to further private ends than were it composed of private individuals. I recommend the matter respectfully to your consideration.

SULPHUR IN GAS.

At the last meeting of the Manchester section of the Society of Chemical Industry Mr. R. F. Carpenter brought forward the question of the injury done by the amount of sulphur in gas. He said that the Crystal Palace District Gas Bill had been before a Committee of the House of Lords recently and one of the objects of that Bill was to permit the company to alter their Act of 1873 in respect of the quality of their gas. As a matter of fact the company being just outside the London district, where the amount of sulphur per 100 cubic feet was limited to 26 grains, sought to obtain power to supply gas containing 30 grains per 100 cubic feet. They called as witnesses Professor W. Odling and Professor Vivian Lewes. The former stated that the fixing of a 20 or 30 grain limit or no limit at all would practically make no difference to the consumer. He went on to say that, taking a gas that contained 30 grains of sulphur in 100 cubic feet, if the consumer burned that 100 cubic feet in the course of six hours, which they might easily do from

four burners at the rate of $4\frac{1}{2}$ cubic feet an hour, the amount of sulphur discharged into a room would be at the rate of five grains per hour. Supposing the gas contained 20 grains instead of 30, the amount of sulphur would be about $3\frac{1}{4}$ grains, so that the difference would represent $1\frac{3}{4}$ grains per hour. The difference between 20 and 30 grains of sulphur was productive of no injury to books or furniture, and the injury which resulted from burning gas in ill-ventilated rooms was, not at all due to the minute quantity of sulphur which it contained. The injury done to the bindings of books had, in Dr. Odling's opinion, also been wrongly ascribed to the sulphur compounds. Professor Lewes, in his evidence, said there was a general belief that sulphur was injurious, but it was his strong opinion that it was an absolute fallacy, and that the difference between 20 and 30 grains would not cause any such injury as had been suggested.

Mr. G. E. Davis, in criticising the statements of Dr. Odling and Professor Lewes, said he was surprised to hear the statements made by Dr. Odling on such a subject as that of the damage done by a large amount of sulphur in gas, because that was a thing that could be determined experimentally. From the experiments he had made he was convinced that the presence of a large quantity of sulphur in gas was decidedly injurious to furniture, books, &c. In Manchester, where the amount of sulphur per 100 cubic feet was 40 grains, its presence in an ill-ventilated room could easily be detected by mounting to the top of the room. If the gas had been burning some time the top stratum of air was so bad that no one could breathe in it for very long. The statements made by Dr. Odling were most mischievous, because they were sent out to the world with a certain stamp of authority, and they would be continually raked up by people who wished to prove that the amount of sulphur in gas had nothing to do with our state of health.

Mr. J. Dreyfus thought it was ridiculous for any chemist to say that the quantity of sulphur contained in gas was not injurious to health. Strong people would perhaps throw off its effects easily, but it would be very hurtful to people suffering from disease of the lungs. He did not think it was right that a chemist should lend his name to such misstatements as those made by Dr. Odling.

Mr. Carpenter stated that the evidence was not successful. The promoters of the Bill accepted the 20-grain limit on condition that no action should be taken against them unless the average was taken by the week and not by one particular test.

THE ROYAL AGRICULTURAL SOCIETY.

THE annual meeting of the Royal Agricultural Society was held on Monday. The Duke of Westminster presided. It was mentioned in the annual report that through the generous action of the Duke of Westminster and Mr. Walter Gilbey, a part of the site of Harewood House, in Hanover Square, had been acquired, and it was proposed to erect upon this site a new building for the accommodation of the society, and of such other kindred agricultural associations as might wish to be located therein. The sum required for the purchase of the freehold of the site and the erection of the new building was estimated at 65,000*l.*, and the council had resolved to invite subscriptions for stock to be issued for an amount not exceeding 65,000*l.*, to carry interest at the rate of 3 per cent. per annum, secured upon the new premises. Mr. Frederick King said that the estimate was placed at too low a figure, and that to build premises worthy of the society it would cost at least 20,000*l.* more than was anticipated. The Duke of Westminster replied that the committee hoped to erect a very modest and respectable building that would be suited to the requirements and aspirations of the society. The report was adopted.

JERRY BUILDING.

THE following are extracts from correspondence in the *Standard* :—

"Householder" writes :—I am living in a house in West Hampstead, for which I pay quite a fair rent ; it has not been built two years, but in such a manner that it is almost falling down upon my head. A large piece of ceiling has already fallen sufficient to kill anyone that happened to be underneath at the time. There are large cracks in the walls of one room, and the corner has sunk half an inch, leaving a large crack down the wall. I go to bed every night in terror, for fear of a piece of ceiling descending upon me before morning.

A "Lee Householder" replies :—"Householder's" jerry-built house must be built upon a rock, for his experiences are trifling compared with mine. Some time ago one of my sons fell through the breakfast-room floor, and found himself ankle-

deep in wet clay. Eventually half the room had to be re-floored, the carpenter wading about in the clay and water, which had rotted away the boards. The wainscoting in several rooms has fallen in, and through one we can see daylight. Thirteen ceilings fell in twelve months, and so far from going to bed in terror, we have become so reckless that a few months ago, when the bathroom ceiling during the night fell with a crash, we simply turned over in our beds, and with a yawn lazily exclaimed, "Another ceiling down, I suppose !" Sometimes the noise of the water-pipes warns us that the floods are about to lift up their waves, and the staircase quickly becomes a miniature Niagara Falls.

A "Tenant" adds :—We must presume, I suppose, that all existing houses conform to the requirements of the Building Acts, but how strongly does this show that these Acts need serious amendment ? Until recent years 14-inch walls were the rule. Now they are the exception, and a 9-inch wall nearly always prevails, not only in low-rented houses, but even in those "eligible family residences" for which they have the conscience to ask rents for which an ordinary tenant would be entitled to expect to get a thoroughly well-built house. I should much like to be informed by some competent authority whether a 9-inch wall is thick enough for health and comfort. It may be just enough to support the light and slender roof of sparest timber and thinnest slates ; but it cannot, like the walls of old, defy both cold and damp. Houses of the present style, with no basement, have scarcely any foundations. The soil on which they stand is generally in its original state beneath the flooring of the sitting-rooms. No concrete, asphalt or other impervious substance intervenes. The drains in most cases are beneath the floor. The upper rooms have an Arctic temperature in winter and a tropical heat in summer, the slates being only fixed on battens. Can we wonder at the large amount of delicate health which exists and at the prevalence of diphtheria and other kindred diseases ?

THE TRENT AND MERSEY CANAL.

ABOUT two years ago the North Staffordshire Railway Company obtained statutory powers to raise money for the purpose of widening and improving the Trent and Mersey Navigation. The carrying out of the improvement scheme is necessarily a work of time as well as of great cost, but the matter has been taken earnestly in hand, and the canal between Middlewich and the Anderton hydraulic lift, a distance of about eleven

miles, has been widened, deepened and otherwise improved so as to allow of the passage of barges of a larger class. This will not greatly affect the traffic of the Potteries, but it is a matter of interest to North Staffordshire traders as the first instalment of an improvement which the company have practically promised to extend right up to the Pottery towns. It may be mentioned that the ordinary class of canal boat carries a freight of from twenty-five to thirty tons, and is not able to navigate the Mersey. The enlargement of the canal will enable a new type of boat to be used, carrying from forty to sixty tons, capable of navigating the Mersey, and thus avoiding the inconvenience and cost of transhipment. As stated, a passage for the larger boats has at present only been made as far as Middlewich. At the latter place, what was known as the pool, formerly only some 16 feet in width, has been widened to 50 feet by the erection of a massive concrete wall, which separates the waters of the river and canal. The wharfage has been largely extended, and steam-cranes and other appliances for dealing with a large traffic are being provided. A little lower down, the only lock existing between Middlewich and Anderton has been widened to 16 feet 6 in., and throughout this section the waterway has been widened by several feet and dredged to a uniform depth right across. An important feature of the widening is that for about four miles a solid wall of masonry, averaging 4 feet 6 inches in depth, has been built alongside the towing path, so that a sufficient depth and width of waterway is made to allow two barges to pass at any point between the bridges. Some two miles yet remain to be done, the other portion of the section being already walled. A steam dredger, of the Priestman type, and twelve spoon boats have been constantly employed, and during the last fifteen months from 80,000 to 100,000 tons of stuff have been removed. It has been necessary to rebuild and widen all the bridges, in order to admit of the passage of larger craft, no less than eighteen being so dealt with altogether. The roadways over the bridges have in most cases been widened, and the old steep approaches run out at easier gradients. Most of the work has been done without interfering with the traffic, and the fact that such an extensive undertaking should have been carried out practically to completion with only about twelve days' stoppage out of fifteen months testifies to the skill and forethought of both the engineer and contractor. The works have been carried out from the plans of Mr. E. B. Smith, canal engineer to the North Staffordshire Railway Company, and the contractor for the walling and the bridges was Mr. F. Barke, of Stoke.

WATER RESOURCES OF LONDON.

THE *Standard* says:—The discovery of the lower greensand, with its large supply of excellent water, by means of an artesian boring in Windsor Forest, is a matter of considerable importance to the inhabitants of London, as helping to show the extent of the underground sources available for the supply of the Metropolis. Wells sunk to a great depth in the chalk have hitherto furnished the best water that London has received; but there is only one district out of eight where this is unmixed with a large proportion taken from the Thames or the Lea. The lower greensand has long been sought, as containing water superior to even that of the chalk, being much less hard and therefore well adapted for domestic use. A purer supply is scarcely conceivable, as proved by that which is obtained from the artesian well at Grenelle in the suburbs of Paris and others elsewhere. Reigate, in Surrey, and the neighbourhood of Baldock, in Hertfordshire, afford the nearest examples of greensand water in the vicinity of London. Windsor appears to fall naturally within the area of the metropolitan supply, as it lies in the Thames valley not far above the intakes of the London companies. At Baldock the population is supplied from the chalk, the greensand water being only obtainable a few miles to the north. In that locality the gault was penetrated by means of a well, and on the lower greensand being reached the water rose within three feet of the surface. At Reigate there is a company supplying water from the lower greensand, and the stratum has also been reached at Merstham. But all attempts to get at this formation in the immediate neighbourhood of London have failed, owing to the uprising of the primary rocks cutting off the continuity of the lower greensand, which otherwise would pass under London in the same way that it is known to do under Paris. The discovery now reported is hopeful, as showing the presence of the desired stratum to the west of London at a moderate distance. There is also the important fact that the water rises to an altitude which shows that the boring is a true artesian well. More water of the same kind must be near at hand, and although the Windsor Forest boring is nearly a quarter of a mile deep this affords no serious objection. The well at Grenelle is nearly 500 feet deeper. The Royal Commissioners who reported on the London water supply above twenty years ago were strong in their belief that the subterranean sources of a pure supply were peculiarly large within a radius which London could easily command.

KALLKOLITH.

NEW PATENT PRIMING AND STAIN.

Acknowledged by experts of nearly every country to be one of the most important inventions of the Nineteenth Century.

KALLKOLITH is one of the most marvellous inventions of the present age, and is used as a priming in place of the now almost obsolete oil-colour. It produces an exquisite smoothness, combined with great durability, and amalgamates thoroughly with wood, iron, cement, stone, plastering, &c.

CHEAPNESS.—It saves at least 100 per cent. in comparison with any other priming now in use, being less than half the weight.

ECONOMY is manifested by the fact that one 14-lb. tin of KALLKOLITH goes further than three times the same quantity of oil-colour.

DRYING POWERS.—It dries within one to two hours, thereby greatly facilitating the quick dispatch of labour.

DURABILITY.—Where KALLKOLITH is used it imparts an amount of durability to all oil-colours used upon it which has never yet been obtained, and one of the most important advantages in its use is that the paint put upon it does not blister.

PAPER-HANGING.—Walls prepared with KALLKOLITH, thinned with seven parts of water, give a great additional advantage to the hanging of all descriptions of papers.

Price per case of 8 Tins of 14 lbs. each, net 40s., packing included. Special Terms to Wholesale Buyers and Shippers.

Address—E. STUTTARD, 88 ADELAIDE ROAD, BROCKLEY, LONDON, S.E.

TRADE NOTES.

THE Princess May has been pleased to accept the gift of a Yost type-writer, and has desired the Comptroller of the Household at White Lodge, Richmond, to thank the managing director of the Yost Typewriter Company for the present, and for the congratulations and good wishes which the company have tendered at the present juncture.

MESSRS. JOSEPH KAYE & CO., Limited, of 93 High Holborn, and the Lock Works, Leeds, have supplied their patent exit door furniture and bolts to the doors of the Imperial Institute.

THE Bradford County Council have accepted the tender of Messrs. H. Birkby & Sons for the construction of a tar tank at the Valley Road Gasworks, for 4,295/.

THE Secretary of State for Foreign Affairs has learnt from Her Majesty's Consul-General at Salonica that tenders will be received on the 1st proximo for the construction of the first hundred kilometres of the Salonica-Dedeagatch Railway. The documents relating to the tenders and the execution of the work can be seen at the office of the chief engineer at Salonica, and at 417 Grand Rue de Péra, Constantinople. Tenders for the construction of the remaining 400 kilometres of the line will be received between August and October next.

THE Building Committee of the Carlisle Corporation have accepted the tender of Messrs. Latimer Clark, Muirhead & Co., Limited, Regency Works, Westminster, amounting to about 1,450/ for the installation of the electric light at Tullie House. The tender does not include the foundations and the masonry and joinery work, but it includes gas-engines and the provision of duplicate plant as a safeguard against accident.

AT the Bath and West of England Show at Gloucester this year, Mr. Charles D. Phillips, Newport, Mon. and Gloucester, was well represented in the machinery and implement departments, and had in connection therewith an office covered with his patent "lock-jaw" roofing tiles, the "single-grip" system being shown on one side and the "double-grip" on the other, the whole being tastefully finished off with two elaborate "Griffin" finials, with weather-boards and ridges to match. We understand that Mr. Phillips has had considerable difficulty in keeping up with the demand for his patent tiles during the past half-year or more, and has now made arrangements for a greater output from his works at Bridgwater, and this fact, in addition to the several recent testimonials received, points very

conclusively to the continued success of these tiles. One order has been received from Australia for 24,000, with the promise of further business if the supply can be kept up to the demand.

THE Guisborough Board of Guardians have selected the tender, out of sixteen others, of Mr. G. M. Rudge, Normanby, at 3,235/., for the building of their workhouse infirmary.

THE contract for forming the new streets on Carlisle Sands has been let to Messrs. Beatty Bros., builders, Carlisle, who have undertaken to do the work at a cost of between 1,500/ and 1,600/.

VARIETIES.

UNDER date May 30 Mr. B. T. Batsford writes:—"I shall be much obliged if you will kindly find room in your columns to mention that after June 5 my business, which has for over forty years been carried on at 52 High Holborn, will be removed to more convenient premises, No. 94 High Holborn."

THE Mersey Docks and Harbour Board at their meeting confirmed the recommendation of the Warehouse Committee of the 17th inst. to make certain alterations at a number of the hatchways at the Albert Dock warehouses, at a total estimated cost of 1,050/.

A MEETING of Linlithgow Police Commissioners has been held for the purpose of considering as to the establishing a Dean of Guild Court for the burgh. The following members were appointed a Court, viz.:—Dean of Guild Fleming, Provost Gilmour, Bailies M'Alpine, Morrison and Russell, Treasurer Jamieson, and Councillor Philip. Mr. James Bambery, burgh officer, was appointed master of works to the Dean of Guild Court.

THE Stourbridge Commissioners having agreed to purchase the local gas undertaking, referred the amount to be paid to arbitration. The umpire's award has now been received, the purchase money being fixed at 99,800/.

THE Athens correspondent of the *Standard* says:—"According to the report of the Ephor who has been commissioned by the Government to represent it at the excavations the French are carrying out at Delphi, a colossal marble head has recently been found there almost intact. It evidently belonged to a great statue of Apollo, which was erected at the Delphic Oracle in ancient times. The hair is represented as tied up with a riband, and the brow is encircled with a crown. A metope has

been discovered which belonged to the building which was the Treasury of the Athenians at Delphi. It represents a fight between bulls. Twenty Consular votive inscriptions have also been found referring to the deliverance of slaves.

PLANS have been prepared for extending Devonport Dockyard, and, if carried out, Devonport will be one of the finest naval ports in the world. The Government have assented to an expenditure of 70,000*l.* for the pier and 15,000*l.* for machinery at Keyham for extending the coaling arrangements. The plans include the building of three new docks, one 600 feet and the other two 500 feet in length, the docks being entered from a basin 700 feet wide, while the basin itself is entered from a lock 600 feet long.

THE *Scotsman* says:—A fine specimen of ancient carving has just been brought to light in the parish church of Holm—a well formed and well preserved cross carved on stone. It seems to have been originally fixed in the ground as a headstone, or more probably, since it has no letters, name or date on it, was used to mark the place where the first missionaries of the Cross preached the Gospel in Orkney, like the famous one still preserved in Ruthwell parish church. Mr. James Linnie, Ducro, the oldest inhabitant, within a few weeks of ninety, says it was found many years ago buried in the floor of the church, when repairs were being executed many years ago (may it not have been hidden there from the ruthless hands of the over-zealous Reformers?). It has long lain in a neglected corner, but Mr. Peace, architect, Kirkwall, has now obtained leave from the heritors to have it placed in a suitable position in the wall of the church.

THE Lancashire and Cheshire Antiquarian Society lately made an excursion to Cambridge. Among the places of interest visited under the guidance of Mr. J. Pink, chief librarian of the Cambridge Free Library, were Emanuel College, Christ College, Magdalen College, and St. Peter's Church. The various objects of interest and historical associations connected with the several buildings were pointed out. Under the leadership of Mr. J. D. Atkinson, secretary of the Cambridge Archaeological Society, the party visited Pembroke College, the museum, St. Peter's, Queen's and St. John's Colleges, and King's College. Finally the members went to Jesus College, of which they were shown the many interesting features.

AT the quarterly meeting of the general court of governors of the Middlesex Hospital the court authorised the expenditure of 2,093*l.* on new teak floors, painting and repairs.

THE Local Government Board have granted a provisional order to the Honley Local Board for the compulsory purchase of about seven acres of land for precipitation tanks and land filtration. The provisional order was opposed by the Huddersfield Corporation and the land owner. Before carrying out the scheme, however, the Honley Local Board have asked the Huddersfield Corporation on what terms they would allow the Honley sewage to be connected to the Huddersfield system. Mr. W. H. Radford, C.E., of Nottingham, is the engineer for the Honley scheme.

THE Local Government Board have also issued a provisional order granting to the Macclesfield Corporation compulsory power to purchase about 200 acres of land about three miles from Macclesfield for sewage-disposal purposes. Application will soon be made to the Local Government Board for sanction to a loan to carry out the works. Mr. W. H. Radford, C.E., of Nottingham, is the engineer.

AT Glasgow a tenement of dwelling-houses at the junction of Abercorn Street and Burnside Street, has become so seriously undermined, owing, it is said, to the subway operations in the neighbourhood, that an order has been issued by the Dean of Guild Court to have the building reconstructed, and the tenants have been warned to immediately vacate the houses.

IT is stated that for the first time the Board of Trade has sanctioned the use of automatic signals on a railway, in the case of the overhead electric railway in Liverpool, and though the line is only seven miles long, the company will save from 2,000*l.* to 3,000*l.* yearly in signalling expenditure.

A PUBLIC meeting has been held urging the desirability of rebuilding Lambeth Bridge. Last year the County Council resolved that it should be rebuilt, but in the meantime a proposal has been made to reconstruct Vauxhall Bridge at a cost of 400,000*l.*, with the possible removal of Lambeth Bridge.

THE *Nottinghamshire Guardian* says:—Although the fifteenth exhibition of pictures in oils, water-colours, and black and white by local artists at the Castle Museum cannot be designated as "important" in the numerical sense, it is interesting as marking a distinct advance in quality of work. The hanging committee have exercised great care this year. Quality, and not quantity, appears to have been their aim.

THE Gas Committee of the Aberdeen Town Council have decided to appoint an engineer, at a salary of 200*l.* a year, to take charge of the electric lighting department.

BUILDERS' BENEVOLENT ASSOCIATION.

AN election of one pensioner on the funds of this charity took place on Thursday, May 25, at the office, 35 Southampton Row, Bloomsbury Square, W.C., Mr. George Plucknett, J.P. (hon. treasurer), presiding. One man only had to be elected, and the voting was as follows:—J. L. Mould, 60 Muriel Street, Islington, aged seventy-one, builder (third application), 1,791 votes; Alfred Clement, 115 Bedford Road, Brixton, aged seventy-two, builder (first application), 1,020 votes; Jace Taylor, 14 St. James's Road, Bermondsey, aged sixty-one, master slater (first application), 701 votes. Votes were also given for the following women applicants, viz. Sarah E. Drake, Tilers' and Bricklayers' Almshouses, aged sixty-three, widow of builder (fifth application), 2,647 votes; Susanna Mansell, Hammersmith, aged seventy, widow of builder (fourth application), 2,953 votes; and Mary Anne Healing, 20 Curtain Road, Shoreditch, aged sixty-three, widow of builder (third application), 210 votes. The successful candidate was J. L. Mould.

Messrs. Thomas Stirling and T. F. Rider acted as scrutineers, and amongst the friends of the charity present were Messrs. J. W. Mitchell, C. Bussell, G. M. Watts and T. Stirling, junior.

Votes of thanks to the chairman and scrutineers closed the proceedings.

RUSSIAN INDUSTRIAL ART.*

RUSSIAN industrial art is so wide a subject, that to treat it properly would be quite impossible in the compass of one lecture. I propose, therefore, to take you with me through Russia, drawing your attention to certain points relating to her arts and industries.

My first experiences of Russia were at St. Petersburg, that capital which owes its existence to Peter the Great—a city of stately palaces, of immense squares, of handsome monuments, but with little distinctively Russian about it. St. Petersburg was the window from which Peter looked into Europe. When he came to the throne, Russia was in a non-progressive state, clinging to the past with its superstitions and traditions, and

* A paper read before the Foreign and Colonial Section of the Society of Arts by Mr. E. Delmar Morgan.

bearing the impress of the Tartar yoke. He determined to cut asunder the bonds which tied her to the East and create a new Russia by opening the door to Western civilisation.

It has been said that Peter's reforms did more harm than good to his country by interfering with her gradual development, that Russia left to herself contained all the elements of national greatness, and that it was too soon to polish her in accordance with western ideas. However this may be, there can be no doubt that the genius of Peter raised Russia to the rank of a first-rate power, and that, had it not been for his reforms, she would have remained in a semi-barbarous state, a stranger to the arts, the industries and the sciences of Europe.

St. Petersburg is a medley of Italian, French, German and Dutch styles, or rather it has no architectural style about it. In its chief street—the Nefsky Prospect—you might imagine yourself in Turin, or Paris, or Munich, were it not that the painted sign-boards over the shop fronts, the dress and appearance of the people, and the mode of harnessing the horses, remind you that you are in Russia. St. Petersburg, however, contains magnificent public buildings and many priceless treasures of art stored away in palaces, museums and private collections.

St. Isaac's Cathedral, designed and built by the French architect, Montferrand, with its five gilt domes, its monolith columns of polished granite and its gorgeous interior, is a grand conception carried out in spite of every difficulty. The design is foreign, the malachite and lapis-lazuli columns before the altar screen are hollow, the splendid mosaics are of foreign workmanship; yet the whole edifice is impressive and has something distinctively national, if only in its vast proportions and in the costly materials used in its construction. None but a Russian Tsar, the head of Church and State, could have, at so lavish a cost, erected so noble an edifice designed solely for the worship of God. Mr. Beavington Atkinson, in his work, "An Art Tour to Northern Capitals of Europe," says:—"The world owes its great cathedrals to the combined religious and temporal power." St. Petersburg—this northern Venice, as it is called—is in startling contrast with the squalor and poverty surrounding it. When once you are beyond the twenty-mile radius and have left behind the capital and its elegant suburban retreats, you are in a wilderness of marsh and scrub wood, with here and there a village of dilapidated log-huts and a poverty-stricken agricultural population barely furnished with the necessities of life.

The Hermitage, so called by its Imperial foundress, the

THE WELL-KNOWN FRIEZE,

ENTITLED

"THE CORN FIELD."

1. PLOUGHING; 2. HARROWING; 3. MOWING; 4. CARTING; 5. THE PRODUCTS OF THE CORN FIELD.

Length, Fourteen Feet Seven Inches by Fifteen Inches deep.

A Splendid Example of Colour-Work in Permanent Ink Photo,
BY M. PAUL ALBERT BAUDOIN.

This magnificent Illustration was presented to the Subscribers to "The Architect" in 1886. A few Proofs were taken, which immediately became out of print.

OPINIONS OF THE PRESS.

"We are not surprised to hear that there has been a great demand for the beautiful reproductions of the well-known frieze by M. Paul Albert Baudoin, entitled 'The Corn Field.' The plates have been reproduced by subscription at half a guinea the set, and so great has been their success that a second edition is being issued."—*The Lady's Pictorial*.
"They are beautifully done in colours by the permanent ink photo process, and form a very artistic and pleasing set at the extremely moderate price of half a guinea."—*The Stage*.
"The well-known frieze entitled 'The Corn Field,' which is a splendid example of colour-work in permanent ink photo, by M. Paul Albert Baudoin, is to be reproduced by subscription of half a guinea a set. They are exceedingly artistic, and would grace the walls of any house."—*The Gentlewoman*.

AND NUMEROUS OTHERS.

In consequence of the almost daily demand for these Plates, they have been reproduced by Subscription at Half a Guinea the Set, and are now ready for issuing.

P. A. GILBERT WOOD, 175 Strand, W.C.

Empress Catherine, is a palace of art, in its way as splendid as St. Isaac's. Its collections, comprising the famous treasures found at Kertch, are unsurpassed. Here are specimens of Greco-Scythian and other early arts, which have helped to build up the Russian art of to-day. What this Russian art is and of how many elements composed, are questions upon which authorities differ. Besides Greco-Scythian, Scandinavian, Greco-Byzantine, Mongol, Indian, Persian, Central Asian and Finnish have been mentioned. To these have to be added the later influences of Western Europe—Italian, German, French and English. With regard to Scythian, M. Vladimir Stasoff has pointed out in the "Magazine of Art" that Mr. Alfred Maskell (who follows M. Viollet-le-Duc), in his South Kensington "Handbook of Russian Art," is wrong in identifying the nomadic Scythians depicted on this celebrated Nikopol vase with the ancestors of the Russians, for the Poliani-Kiani, whom Nestor mentions as the ancestors of the Russians, were a peaceful, agricultural people, altogether distinct from the warlike Scythians of Southern Russia, and Father Martinoff takes the same view.

Composed of so many and such heterogeneous elements, one might have supposed that the native art would have altogether disappeared; yet in spite of these adverse circumstances there remains a substratum peculiarly Russian underlying the foreign superstructure. This native art may probably be seen at its best in the works of the young Russian school of painters, sculptors and authors, in their efforts to attain realism, to make the canvas, the stone, the bronze and the writing speak for them and tell of the realities of Russian life. This realistic side of Russian art is exceedingly interesting, for studies of real life are often true to nature, while attempts at an ideal in religious art, for want of inspiration, fall short of the sublime.

There is hardly a cathedral, church or monastery throughout the Empire that has not some traces of Greco-Byzantine influence. St. Sophia at Kiev, with its mosaics of the eleventh century, and the cathedral of the Assumption in the Kremlin, at Moscow, are examples of the earlier style. The plan of all these buildings is the Greek cross, a dimly-lighted, almost dark interior, walls painted with frescoes, a gorgeously decorated ikonostas, or altar-screen, and a great central dome or cupola. The general effect, during a religious ceremony, heightened by lighted tapers, burning incense, the chanting of the choir and the rich vestments of the priests, is very impressive.

While following Byzantine models in the general design, Russian architecture adopted a peculiar form of cupola, re-

sembling an onion, altogether distinct from the domes of St. Sophia at Constantinople, St. Peter's at Rome, St. Paul's in London and St. Isaac's in St. Petersburg. This bulbous cupola, said to be of Central Asian origin, and surmounted by a cross rising from a crescent, is characteristic of ecclesiastical architecture in Russia.

In decorative art, these same Byzantine influences, due to the close intercourse between Russia and the Eastern Empire before and after the introduction of Christianity, are equally conspicuous. They may be noticed in the silver pectoral crosses and other metal-work, the wood-carving, the embroidery on leather, and even in the textile fabrics. The English and foreign embassies which visited Moscow in the sixteenth century were much impressed with the gold and silver plate in the Tsar's palace. Some of this was doubtless brought as presents from foreign countries, some was the spoil of war, but the greater part was manufactured in Russian workshops. In 1880 our Government applied to that of Russia for permission to reproduce some of the numerous examples of English plate and other works of art in the imperial collections. The Emperor having graciously consented, a number of electrotype facsimiles were made and brought to England. These are exhibited in the galleries at South Kensington. They include vases, cups, flagons, salts, tankards and jugs, besides a number of other pieces used at state banquets. Russian silversmiths' work has obtained a world-wide reputation both for elegance of design as well as for the purity of the metal used.

Enamelling on gold and silver is another art peculiarly Russian, derived also from Byzantine and Eastern sources. When Russian art ceases to be Eastern in character it will have lost its claims to be regarded as a national art. Imitations of English, French and German designs, however skilfully made, for the Russian artificer is a good copyist, are, after all, only imitations. To form a true idea of Russian art it is necessary to visit Moscow, Novgorod, Kiev and some of the monasteries and churches. But I must now say something of the manufacturing industries centred round Moscow.

Before the reign of Peter the Great, the industry of Russia was of a domestic, local character, and confined to villages. The chief articles of manufacture were woollen goods, cordage made of hemp, a coarse kind of linen, leather, metal-work and articles made of wood. These were for home consumption as well as for export abroad. After the famous act of Boris Godounoff, obliging the peasants to give up their roving propensities and become fixed to the soil, the native industries

greatly increased, that of leather especially benefiting. The leather industry was then centred in the governments of Kazan, Nijni Novgorod, Moscow, Yarozlaf and Kostroma; tallow-melting works were also numerous; soap was manufactured at Kostroma; tar came from the district of Kargopol and the Vaga, where potash was also produced for export; Moscow wove cloth and silk stuffs, deriving the raw material from Persia; Kholmogory produced ironbound trunks and cases; Yarozlaf, small ironware; Tula was the small arms factory, a position it has retained to this day; from Vladimir came the ikons, or religious paintings on wood. As the demand sprang up for some new article, whole villages devoted themselves to its production, and these industries became hereditary, descending from father to son for generations. The next step was their organisation on the factory system, the domestic character of the industry being still retained. Thus, in the time of the Czar Alexis Mikhailovitch, iron and bell foundries attained a certain degree of development. The government of Olonetz was the first seat of the native iron industry, now transferred to Southern and Eastern Russia. Gunpowder was then manufactured near Moscow, writing-paper and glass in the neighbourhood of Moscow. But the great impetus was first given to native industry by Peter the Great, who conceived the idea of planting the arts and industries of Western Europe in Russia. It is well known how he laboured himself in acquiring a practical knowledge of these arts in Holland and England. In Russia his efforts were untiring. He invited foreigners to come over, encouraged them to establish factories, protected these by all kinds of privileges, and, what was of the greatest importance, established Government factories to which villages were attached. The export of raw produce useful for manufactures was prohibited, the import of foreign fabrics limited. The Government became the chief buyer of the produce, often paying dearer than its value. Lastly, a separate college was founded for the encouragement and protection of manufacturers.

By the end of Peter's reign Russia numbered 250 manufactures, including almost every known branch of industry at that time. But the measures taken to bring these into existence were of an artificial nature, and gave rise to monopolies, the evil effects of which were felt for the fifty years succeeding Peter's reign. About 1770, however, notions of free trade made their way into Russia, and led to a reversal of the protective system. The privileges were withdrawn, the college of manufactures was closed, and the foundations laid

of a more normal development. It was not, however, till about the middle of the present century that free trade began to exercise a marked influence on Russian political economy, the tariffs of 1850, 1857 and 1869 having gradually adopted a more moderate scale of duties, better suited to the requirements of the country. Nevertheless, many years will probably elapse before the protective system is entirely done away with, for the artificially-created industries of Russia have obtained so firm a hold that any sudden change might cause widespread distress and financial derangement.

The manufacturing industries may be grouped under the following heads:—

1. Textile fabrics, including those made of wool, flax and hemp, cotton, silk, with their contributory processes, such as gold thread and cloth of gold brocades, calico-printing, dyeing and bleaching, &c.
2. Products of wood, including builder's material, joiner's work, parquet flooring, turner's and cooper's work, articles made of bark, matting, tar, pitch, turpentine, &c.
3. Animal products, *e.g.*, leather in all its branches, tallow, wax, hair and bristles, and miscellaneous articles, such as horn, bone, glue and feathers.
4. Mineral products, such as bricks and tiles, pottery, china and porcelain, glass, chalk, alabaster, mortar and cement, stone-cutting and polishing, and pencils.
5. Metals, comprising cast-iron, wrought-iron and steel, with their products, copper and the precious metals, with their products.
6. Chemicals, including dyes, potash, sulphur and sulphuric acid, vinegar, lacquer, cosmetics.
7. Tobacco.
8. Food products.
9. Miscellaneous, including carriages, musical instruments, straw fabrics, &c.

To examine all these in detail would take up far too much time. I shall, therefore, confine my remarks to those with which I have had some personal acquaintance.

The cotton industry, dating only from the middle of the last century, now occupies the foremost place among Russian industries. The first calico printing works was established in 1764; in 1793 the first spinning mill was started; in 1805 yarn was first woven by machinery at Alexandrofsk, near St. Petersburg. About 1820 this industry acquired some development in connection with village industries, especially at Ivanovo, now a very important centre, where the commoner kinds of calico

WORKS, ROTHERHAM, Estab. 1854.

were woven under the superintendence of German artisans, at the beginning of this century. But the chief development of the cotton industry was due to the free importation of English looms in 1840. About that time (1843) my father founded the Petrofsky Cotton Spinning and Weaving Company, at Alexandrofsk, on the left bank of the Neva. About twenty years later, when the number of cotton mills had largely increased, and the competition was much greater, he acquired by purchase the Schlüsselburg print works, situate on an island in the Neva, where this river issues from Lake Ladoga. Here, abundantly supplied with the purest water, and furnished with the most costly machinery that Manchester could supply, the Schlüsselburg Calico Printing Company soon took rank among the first establishments of the kind in Russia. They are at the present day in full work, turning out an enormous quantity of prints.

To give an idea of the growth of the cotton industry in Russia, I may mention that, in the period of 1866-79, the production of prints increased 167 per cent., while the number of works diminished 19 per cent., this increase in production *pari passu* with the diminution in the number of manufactories being attributable to improved machinery; for while in 1866 one man produced 178½ pieces of print, in 1879 he produced nearly 100 per cent. more. The spools spun in 1866 aggregated 1,895,500 puds (30,000 tons), in 1879 4,290,000 (70,000 tons). The calico woven in 1866 amounted to 3,972,000 pieces, and in 1879 to 14,821,000. In 1866, 3,384,000 pieces of calico were printed; in 1879, 9,050,000 pieces. In 1866, the number of hands engaged was 94,566; in 1879, this number had risen to 162,691. These figures will serve to show what great strides Russia is making in this industry. Later returns are even more striking. The value of yarn spun rose from 42 millions of roubles in 1867 to 133 millions in 1888. With this increased production the number of mills remained stationary, while there were fewer print works, proving that the industry was becoming more concentrated, the smaller establishments being absorbed by the greater.

During the last ten or fifteen years prices of cotton goods have declined, while the standard of quality has risen. The improvement in the art of dyeing is especially remarkable, particularly in reds—the popular colour; and it is stated in a recent work by M. Ruffalovitch, the well-known Odessa banker, that manufacturers like Baranof, Hübner, Zündell, the Tzareva Company, and Morozoff are now able to produce the finer textures suitable for the markets of Central Asia and China,

where Russian manufacturers are competing successfully with those of Manchester.

In forecasting the future of the Russian cotton industry, it may be worth remembering that, while dependent to a large extent on other countries—on America for the raw cotton, on England for machinery, on Mulhausen and Rouen for designs—yet there are signs of the industry becoming nationalised. Central Asia supplies cotton, which, though inferior in staple, does very well to mix with American and other sorts. Russian mechanics are learning to make machinery, and though this branch of the industry is still backward, the time will come when English mechanical skill will no longer be needed in Russia.

If we would see something thoroughly Russian we must visit the forest region of the north—the governments of Archangel, Olonetz and Vologhda, where the population is chiefly occupied in one form or another with the wood industry. Russia, says Mr. Atkinson, is, as far as her arts are concerned, in the period of wood. In winter, with his *topor* or hatchet, the peasant enters the forest, fells the giant pine, the larch, the birch tree or white fir, and drags the fallen log with his little pony to the stacking-place, there to be stamped by the receiver. In spring he rafts the timber down the smaller stream to its confluence with the great river, then down this to the sawmill or seaport. Large numbers of the population find employment and earn a livelihood in this way. The subsequent operations of sawing the round logs into deals, or squaring them for building purposes, is another branch of the industry. The villages in Great Russia are all built of wood. Some of the churches are of the same material, the best to resist the extremes of cold and heat of the climate. There is little room for the display of decorative art in these log-cabins; occasionally, however, the traveller comes to a village where the façades are adorned with carved roof boards, and the window frames and shutters sometimes gaily painted. These have a picturesque appearance, reminding one a little of the Swiss chalet. On internal decorations and fittings the peasant of Great Russia devotes little labour or taste. He is too much concerned with the struggle for existence to have a mind for the beautiful in art. Quite different is the Little Russian. He adorns his *mazanka*, or clay hut, outside and in with flowers, and tastefully embroidered linen cloths disposed on the walls; but the Cossacks of Little Russia are distinct in language, habits, and dress from the Great Russians, so much so, indeed, as to form with these two nationalities.

THE WILSON ENGINEERING CO., LIM., 227^K HIGH HOLBORN, LONDON.

The industrial art of the peasantry is chiefly religious. Pictures of saints, called ikons, painted on wooden blocks or copper, are familiar objects, seen in every Russian dwelling, from palace to log-cabin. These paintings are mostly sombre representations of the Virgin, our Saviour, or some saint, often covered with plaques of silver, silver gilt, and even gold in some of the churches, leaving only the face, hands and feet exposed. A lighted lamp hangs before them on church festivals and saints' days. The preparation of the boards for these paintings is an industry of the government of Vladimir, the painting being done by hand in the monasteries. The method adopted is that of subdivision of labour: one set of monks paint the face, another put in the nose, a third the eyes, so that every feature is rendered in a particular style, which never varies. This is the height of conventionalism in art, and fully accounts for the absence of artistic merit in the ikon. The great sanctity attributed to some of these pictures is due to the miraculous legends surrounding them. For instance, over the sacred gate of the Kremlin at Moscow is a picture of the Redeemer of Smolensk, held in such high veneration that everyone passing under it uncovers his head. The image of St. Nicholas of Mojaisk, of our Lady of Kazan, and many others have all their legendary histories associated with some event in the life of the nation.

It would be interesting to follow up this subject, and trace the history of religious painting from the eleventh and twelfth centuries, when the monks of St. Athos produced a very similar type of sacred picture. Transferred to Russia, the art has remained almost unchanged, the stirring events in her history finding but faint echoes within the strong, fortress-like walls of the monasteries.

Mr. Morfill, the well-known author and reader in Slavonic languages at Oxford, classifies the different schools of ikon painting under the following heads:—(1) The Byzantine or Chersonian school; (2) the school of Moscow; (3) that of Novgorod; and (4) that of Stroganof. According to this authority, the first artists were of Greek origin, but they soon found Russian pupils. The models which had been received at Byzantium were faithfully adhered to at first, but gradually the art of ikonography acquired a different character in each part of the country. But M. Leroy-Beaulieu says that these schools were, strictly speaking, workshops, differing only in their treatment of the drapery and colours. The chief distinction I have noticed is that between the ikons of the old believers and those of the orthodox, the first having adopted a miniature

style of painting, and eschewing all representations of Christ and the Virgin.

In recent times, however, a more artistic style of picture has been produced by the aid of chromo-lithography, and at the Troitsa Monastery, near Moscow, and the Pechersky Lavra, near Kiev, large numbers of these new ikons are sold to the pilgrims.

The industries of cabinet and furniture making have flourished in the governments of Perm, Nijni-Novgorod, Vladimir, Viatka, Tver and Moscow, the furniture of Viatka being celebrated for its cheapness. This is not, however, a very flourishing industry at the present time. The Russian peasant's requirements in the way of furniture are of the simplest; a table and some benches are all that is needed. The only thing he buys is the *sunduk*, or iron-bound wooden trunk, sold in large numbers at all the great fairs.

Of the smaller articles in wood, there is a very large production of spoons, knives, forks, and cups. The wooden spoon, Byzantine in shape, is indispensable in every household, for with this every peasant eats his food. These spoons are sent in large numbers to Central Asia, and with the samovar, or tea-urn, will in course of time help in civilising the nomadising Kirghiz, who now eat with their fingers. We should not omit to mention the important part that matting, made from the bark of the lime-tree, takes in the domestic economy of the Russian people. Of this are manufactured the bags to contain flour, grain, &c., the heaviest and best being those used for flour. The bark of the young lime-tree is stripped to make into sandals, and of these some millions of pairs are required, involving the destruction of an almost incredible number of trees. It takes the bark of four saplings to make one pair of sandals, and it is estimated that ten millions of pairs are required annually. The trees are stripped in spring and summer, when they are full of sap.

The art of dressing leather is one in which Russia has excelled. "Russia leather," known as *yuft*, was an article of export in the seventeenth century, and efforts have been made to improve and develop this industry, but without any marked success. The tannery at Ostashkof, in the government of Tver, on Lake Seligher, at the source of the Volga, continues its old-fashioned methods, supplying the English market (it is curious that this leather should there be known as "English") with nearly the whole of its production, notwithstanding the fact that the secret of its preparation has passed into other countries, and that Austria and Germany manufacture the famous leather at one-third of its cost in Russia. The final

processes in its preparation are done in England, and these enhance its value tenfold, so that by the time it returns to Russia in the form of pocket-books, portfolios, book-bindings, &c., the Russian buyer has to pay dearly for his own leather.

In the same government of Tver is the town of Torjok, once noted for the beauty and picturesque dresses of its women and for its gold and silver embroidery on leather—an art probably learned from the Tartars. The embroidery is all done by the women in winter, and is exposed for sale at the stations on the Nicholas Railway. Specimens of it were shown at the London exhibitions of 1851 and 1862, where they attracted no little attention.

It may be worth mentioning that Torjok is one of those places adversely affected by the introduction of railways. Not only has its famous leather industry declined, but the distinctive dialect, manners and customs of the Novo-Torjians, as they are called, are things of the past. Its picturesque costumes are only to be found in books, and what is more serious, according to a modern Russian writer, its rosy-cheeked, bright-eyed maidens have disappeared.

The iron industry ranks only second to that of textile fabrics in Russia. When I visited the mines and works of the Ural, some thirty years ago, Russia's iron trade was of no great importance. Prince Demidoff's and M. Yakovleff's were then the only large works except those of the Government. At these charcoal iron of a high quality was rolled into rails or hammered into thin sheets for roofing. The growing scarcity of forests, felt even in those days, has limited the production, and the chief seat of the iron industry is being transferred to Southern or New Russia, where iron mines and coalfields have been discovered. But the Ural range is rich in copper, and the precious metals. Semi-precious stones, such as malachite, lapis-lazuli, aventurine, jasper and porphyry are found there. These are cut and polished in the Government works at Ekaterinburg, and adorn the halls and galleries of the Hermitage and other public buildings at St. Petersburg. The objects consist of vases, tables, paper-weights, &c., and are attractive, not so much for any novelty or elegance in design they may have as for the rarity and beauty of the stones, as well as for immense labour expended upon them. The celebrated malachite doors, exhibited in London in 1851, are an instance of this stone-polishing art.

From recent statistics we learn that there were 522 iron mines in the Ural in 1888, producing 49 millions of poods of metal; 20 mines in Southern Russia, with a production of

14 millions of poods; and 63 mines in Poland yielding 12 millions, total amounting to 87½ millions of poods, or nearly 1½ million tons of iron.

When I selected the subject of Russian industrial art for my paper before this Society, I had in view to say something of those village industries to which passing allusion has been made in the foregoing paper, and which I had seen in Little Russia when I visited it in 1888. The so-called *kustarny promysl* in olden times gave employment to many families, and was not confined to one branch of industry or to any particular locality, but comprised textile, ceramic and other industries, and was widespread throughout Russia. Large manufactories and capitalists have put an end to it, but there still survive, in a few out-of-the-way towns or villages, some remnant of these bygone industries.

It was in one of these old-fashioned places that I happened to find myself. The particular village to which I refer is Oposhnia, in the government of Poltava, a great cereal-producing region, and interesting from its having once been the borderland of Russia. It was here that the Cossacks fought against Tartar, Pole and Swede; this, too, was the country of Gogol, the great romance writer of Russia, and it was on these wide plains, now covered with waving corn, that Russia first learnt to become a nation.

The village of Oposhnia is a large one (according to old records it was a town as far back as the twelfth century), and numbers 700 houses at the present day, inhabited by the descendants of those Cossacks who fought under their hetmans, Daroshenko and Briukovetsky. These Cossacks, long since become peaceful settlers, turned their talents to the ceramic art. They are celebrated, too, as horticulturists. Nowhere have I seen more beautiful irises than were growing at the time of my visit in the chief magistrate's garden. Possibly the Oposhnians have imitated the colours of these flowers on their ware, for I noticed a remarkable iridescent lustre about their pottery which I have not seen elsewhere except in Spain. The clay they use is an excellent kaolin obtained in the neighbourhood; this is fashioned by hand into the common dish in universal use in Little Russia, and known there as the *miska*. The design is simple but effective; only three colours are used, prepared from metallic oxides, and laid on the revolving plate in concentric rings, with the aid of a feather fixed into a horn handle; the ground is afterwards stippled in by hand with a brush.

Professor Zankévitch, who has made a study of this art,

says that he found no pottery to equal it except in Switzerland. I found some like it near Seville, but, whatever its origin, the art is one well worth preserving. Besides the ordinary ware of everyday use, the Oposhnia potter occasionally indulges a flight of fancy, and produces some original design, which usually takes the form of a drinking-vessel or bottle to hold spirits. These are curious rather than artistic in shape, though showing ingenuity and skill in the manufacture.

From a few words of conversation with one of these handicraftsmen, I learned that times were not so good as they had been when the local consumption took all his produce. The middleman, that curse of the individual craftsman, had stepped in and undersold him in the market, so that the industry was on the decline.

One more of the village industries of Little Russia must here be mentioned. This is the embroidered *plakhta*, or skirt of many colours, worn by the Little Russian women on holidays. A fashion for these had lately set in, owing to the Empress of Russia having hung one of the rooms of her palace with them. The shirtfronts, or *merejniki*, embroidered with Greek crosses in red thread, are another distinctive feature of the national dress. Shortly before my visit, some French travellers, passing through the country, were so captivated by these shirtfronts that they took specimens away to reproduce in the workshops of France.

A few more words on the future of Russian industrial art. We have seen how it has hitherto largely partaken of a religious character, jealously guarded and controlled by the priesthood and synodal authorities, how this art has become stereotyped or petrified through many centuries of imitation; how intercourse with the West has slightly modified the archaic type of iconography, without, however, emancipating it from tradition. We have seen, too, how Western influences are pervading manufactures, and teaching Russia to make use of her immense material resources. Imbued with these Western feelings, a new school of art has sprung up. Sculpture, hitherto almost forbidden, is now taking a high position, and producing such works as those of Antokolsky, whose statue of Ivan the Terrible was exhibited some years ago in the Kensington galleries, and who has more recently modelled another historical subject, in the seated figure of Nestor, the annalist, of Lieberich and Lanceray, whose spirited groups of horses in bronze have been greatly admired. Among painters, too, there are already many known names, such as Vereschagin, the brilliant realistic artist of Central Asian life and landscape,

Semiradsky, Makovsky, the brothers Sokoloff, and a score or two more.

Stimulated by the exhibitions held at frequent intervals in St. Petersburg and Moscow, and by the Stroganoff school of design in the last-named city, Russian art may have a future; but, whether inspired by the French or the Italian school, the subjects must be thoroughly Russian. They must depict in true colours native life and character, in every part of the vast and varied empire.

PATENTS.

[This List of Patents is compiled specially for this Journal by Mr. G. H. Rayner, of the firm of Rayner & Co., Consulting Patent Agents, 37 Chancery Lane, London, W.C., from whom all particulars and information relating to Patents may be had gratuitously.]

APPLICATIONS FOR PATENTS.

9687. George William Chambers, for "Improvements relating to stove-grates and other fireplaces."

9941. Arthur Raymond Tonks, for "Improvements in padlocks, night latches, mortice locks, and other locks, and in the manufacture of the cases of the same."

9724. James Clark, for "Improvements in firegrates or stoves."

9725. Arthur Collings Wells, for "Improvements in filters."

9737. John Deeble Michell, for "Improvements in sash-fasteners."

9753. William Edward Ayrton and Thomas Mather, for "Improvements in electrical and other measuring instruments and apparatus."

9794. Charles Hattersley, for "Improvements in and connected with fireplaces."

9807. Lewis Du Bois and Melvin Le Grand, for "Improvements in devices for locking drawers, doors, &c."

9841. Frederick William Durham, for "Improvements in hinges."

9911. James William Martin, for "Improvements relating to window sashes."

TRADE NOTES.

TENDERS were considered by the tramway committee of the Glasgow Corporation for the supply of 1,000 tons steel rails and fish plates. The offers included the following:—Messrs. Dick, Kerr & Co., London, rails 4½. 18s. 6d. per ton, plates 4½. 18s. 6d., delivered on quay, Glasgow; Darlington Steel and Iron Company, rails 5½. 1s., fish plates 5½. 1s., delivered at Glasgow station; and the Steel Company of Scotland, rails, 5½. 2s. 6d., fish plates, 7½. 5s., free on trucks, South-Side station, London Road station, or General Terminus. It was proposed that the tender of the first-named firm should be accepted, but an amendment to accept that of the Steel Company of Scotland was carried. When the minute came before the Corporation for adoption, it was resolved by a majority of 41 against 6 to accept the tender of Messrs. Dick, Kerr & Co.

ON Wednesday, the 14th inst., will be put up to auction some freehold land, in large and small sized lots, to be sold on the instalment plan at Gough Park, Enfield. According to the prospectus there are sixty-five beautifully wooded plots on the Forty Hill, Cheshunt, and Clay Hill Roads, and on a new road through the property. Gough Park, with its ancient mansion, its pleasure grounds, its waters and magnificent timbering, was formerly the luxurious country house of an eighteenth-century city merchant, and many of the prominent ornamental features of the estate will be retained for the benefit of purchasers. The Great Northern and Great Eastern railways both have trains running direct to Enfield, so that all intending bidders can easily attend the sale without inconvenience.

THE Edison & Swan United Electric Light Company, Limited, inform us that they are now able to undertake at their works in London, silver plating, nickel plating, and gilding, and are prepared to do such work in quantity at prices compatible with good workmanship and quality.

THE *Liverpool Journal of Commerce* understands that the contract for the extension of the Overhead Railway from the new Rimrose wall to Crosby Road, opposite the Caradoc Hotel, has been let to local contractors, Messrs. Holme & King.

IN reference to the great fire at the timber yard in Walnut Tree Walk, Kennington Road, Mr. T. Forman desires us to state that, although the stock was totally destroyed at Kennington, all orders are being promptly executed from stocks held at the docks and saw-mills.

THE Midland Railway Company's announcement of *table d'hôte* dinners in railway trains, to commence both in first and third class carriages next month, is more of a new departure than it even appears to be, as the work will be done entirely by the use of compressed oil-gas in cooking apparatus specially designed by Messrs. Fletcher, Russell & Co., Limited, at their Warrington house. The gas is carried in cylinders under the saloon, and it is intended to use the same fuel also for warming the carriages in winter. The use of ordinary coal-gas for cooking and heating has spread rapidly for many years past, but the use of oil-gas, of high illuminating power, for this purpose, is at present very unusual, and for railway dining saloons the Midland Company has made the first successful attempt. The running trials have been made some time ago, and the whole arrangements proved quite perfect in every respect the first time the burners were lighted, although they had been designed by Messrs. Fletcher, Russell & Co. from theoretical calculations alone.

THE Works Committee of the Edinburgh and District Water Trust have accepted Messrs. Laidlaw & Co.'s tender, which was the lowest, for cast-iron pipes for the new reservoir at Craiglockhart, amounting to 788½. 15s. 9d.

THE Exmouth Water Company have of late been engaged in an extension of their water area. The taking of this water supply for the town of Exmouth will cut off the motive power from the Bicton Saw Mills, and a large reservoir has to be constructed as compensation. Tenders for the work have been received, and that of Mr. Perry accepted subject to the approval of the engineer, Mr. Cousins.

THE Buildings Committee of the Aberdeen School Board have accepted tenders for the works of the extension of the school in Marywell Street amounting to 1,352½.

THE Highways Committee of the Carlisle City Council have decided to obtain tenders for altering Low Keekle Bridge. They have accepted the tender of Mr. William Dixon for the erection of a new stone bridge at Wellington.

THE Bridgnorth Town Council have empowered the Watch Committee to accept the tender of Messrs. Merryweather & Sons for a steam fire-engine.

AT the meeting of the Worcester City Council the Watch Committee's proposals for making better provision for fire extinction were adopted after considerable discussion. The scheme involves an outlay of 498½. in hose and incidentals.

THE WILSON ENGINEERING CO., LIM., 227^K HIGH HOLBORN, LONDON.

At the meeting of the Stafford Town Council the Gas Committee recommended the laying of new and larger mains from the works to the centre of the town, and the reconstruction of the retort-house. The estimate for the former was 500*l.*, and for the latter 3,000*l.* The recommendation was adopted.

THE Belgian States Railway have ordered from the Lamp Manufacturing Company, Limited, the patent Coligny gas lamp for lighting the whole of their international cars, as well as the state carriage of the king and the post-office vans, and it is anticipated that they will adopt them for the whole of their service.

VARIETIES.

WE are able to state that Messrs. Perken, Son, & Rayment have just issued the prospectus of the Optimus (1893) 100 guinea competition, containing the conditions of competition and application form for entry. The 100 guineas are allotted in prizes of 10*l.* and 5*l.*, or photographic apparatus of those values.

The Improvements Committee of the London County Council have reported in favour of widening the southern end of Tottenham Court Road. The Committee, it is stated, propose that the owners of property on the western frontage shall contribute to the cost, as the property will acquire enhanced value.

THE *Irish Times* says:—The afforesting carried out by the Congested Districts Board in the West of Ireland is now beginning to show the beneficial effects that in the future will be reaped by this important step. At Knockboy, Recess, co. Galway, the works carried out there are proving very encouraging, and the large number of young trees that have been planted show a fine healthy growth this season. The weather seems to have suited them well, and the varieties selected, from their vigorous appearance, seem well adapted for the western climate. All vegetation is fresh and luxuriant.

Stone of Indianapolis says:—There has been at Pittsburgh some complaint among the architects that owing to the long and severe winter we have had, work was entirely suspended on several large buildings here in the city and vicinity, but within the last six weeks building operations have been very active. Indications are that architects, dealers in material,

and contractors will have a very good season, as most of them have already secured about all the work they can perform during the building season. Prices for material are steady, and afford a fair profit to the dealers. Carpenters, bricklayers and stone-masons all seem to have regular employment, and there is no agitation of the wage question between employers and employes, and everything points to a busy and profitable season. Pittsburgh has had completed within the past eighteen months some very creditable and substantial buildings.

THE same journal adds:—George McMullen, well known in Minneapolis and the North-west as a pioneer resident and stone-contractor, died at his home in Minneapolis, May 8. His death was very sudden, there being but a few moments' warning. Mr. McMullen was a resident of Minneapolis for upwards of forty years, and was about eighty years old. He came here from Canada, and followed his trade, that of stone-mason. Before long he was given many of the large stone contracts. He built several of the large mills in Minneapolis, and also did considerable bridgework for railroads.

A BLOCK of warehouses in Grundy Street, Liverpool, in which were stored a large quantity of cotton and grain, has been destroyed by fire. The damage is estimated at 15,000*l.*

LAND and premises in Watergate, Dewsbury, have been purchased by the Dewsbury Corporation for 1,700*l.*, as a site for a refuse-destroyer.

THE foundation-stones of a new pier at Rhos, Colwyn Bay, have been laid. A new road from the pier is being constructed along the sea front, which will open up one of the finest building estates in the principality, connecting Llandudno and Colwyn Bay by a marine drive.

THE *Glasgow Herald* says:—Arrangements were made for the operative masons of Glasgow contributing one shilling each on the first pay day in June, the proceeds to go to the fund for the erection of New Art Galleries. In this way the masons will have a stone in the new galleries.

At a public meeting just held at West Hampstead it was decided to form a deputation to request the President of the Local Government Board to appoint a commission to investigate the present mode of ventilation of the main sewers in West Hampstead.

At the monthly meeting of the York City Council the Estates Committee recommended that, after consideration of the report of Mr. A. Waterhouse, R.A., as to the best method of dealing with the surplus land at the corner of Blake Street and

ALBERT WORKS, ALBERT EMBANKMENT, LONDON, S.E.

Duncombe Place, that no buildings to be erected upon the land should project beyond the line of the Wills Office. Mr. Foster stated that in 1865 the citizens subscribed 8,500*l.* towards opening out the view of the Minster, and he felt sure they would now subscribe the amount necessary to remove the Wills Office and open out the view of the Minster from Blake Street. The matter was adjourned until the next meeting.

THE *Birmingham Post* says:—The deputation of the Markets and Fairs Committee have returned from their visit of inspection of the most modern and improved markets in several of the large towns of Germany, including Berlin, Leipzig, Hanover, &c. The sub-committee have obtained very valuable information, consisting of the details of management, mode of work and plans of the different markets, &c. They are of opinion that the public slaughter-houses and markets on the Continent are very much ahead of anything we have in this country, and that the information obtained will be most valuable in the construction of the new meat market and public slaughter-houses. It is the sub-committee's intention to embody the result of their visit to Germany in a detailed report to the committee.

THE borough surveyor of Walsall has just issued his report, which covers thirty pages in pamphlet form. The total length of the streets and roads now in the borough is about 26 miles 3 furlongs 37 yards.

AT the meeting of the sub-committee of the Plans and Works Committee of the Edinburgh Town Council, arrangements were made for the reception of the American team of firemen. It was resolved that on the day of the visit of the strangers there should be a demonstration by the Edinburgh Fire Brigade in Parliament Square, a drive through the city and to the Forth Bridge, and a luncheon to the party in the City Chambers.

BUILDING AND BUILDERS.

ON May 24 a new centre for manual instruction and instruction in cookery for the pupils of the Church Schools in Birmingham was opened in Bath Row by Sir Alexander Mackenzie, K.C.S.I., Chief Commissioner of Burma. The centre is one of a number which the Birmingham Church Council is endeavouring to provide. The premises adjoin the schools of the church of St. Thomas, and include a cookery school accommodating 76 girls for demonstration and 24 for practice, and a manual

training school fitted with benches, lathes, and tools for 22 boys. Adjoining the cookery school is a house for resident pupils. Additional class-rooms have also been built, and new playgrounds formed, for the exclusive use of the schools of St. Thomas. The buildings have been designed, erected, and fitted up under the direction of Mr. F. B. Osborn, architect, of Birmingham.

CHURCH restoration work is to be carried out at Long Sutton, near Spalding, South Lincolnshire. The contract has been obtained by Messrs. Cornish & Gaymer, of North Walsham, and the work will be at once proceeded with. Mr. Bassett Smith, of London, is the architect. Long Sutton possesses one of the finest old churches in the district.

THE foundation-stone has been laid of the new municipal offices at Bath; Mr. J. M. Brydon, architect, and Messrs. Hayward & Wooster, builders.

THE town-hall and market built from the designs of Mr. Thomas Rowlands, architect, has just been opened at Pontypridd.

THE Glasgow Town Council have approved of the minutes of the sub-committee on the rebuilding of Glasgow Bridge. The estimated cost of re-erecting the structure at the east end of Govan Street was from 51,000*l.* to 55,000*l.* It would be necessary to sink the foundations 90 or 100 feet below the bed of the river.

THE Edinburgh Dean of Guild Court have granted a warrant to Mr. William Wilson to take down certain buildings at Riddell's Court, Lawnmarket, and to build on the site a double tenement of dwelling-houses. These buildings, which are to be erected from designs by Mr. S. Henbest Capper, A.R.I.B.A., are to be of harled front, with projecting timber windows, somewhat in the style of Old Edinburgh, and promise to be rather an ornament to the thoroughfare.

THE Court also gave authority to Mr. W. J. Menzies, W.S., agent for the Church of Scotland, to carry out the extension of the General Assembly Hall. It is proposed to remove the wall which at present bounds the Assembly Hall at its western end, opposite the Throne Gallery, and to carry the interior as far back as the real gable wall of the structure, through which access is at present had to the library. The present library buildings are to be taken down; a site for the library is to be found on the ground immediately to the south, towards Johnston Terrace; and the additional space available is to be utilised for the erection of refreshment-rooms, waiting-rooms, &c.

VOLUME XLVIII. OF THE ARCHITECT.

Handsomely bound in Cloth, Gilt Lettered. Price 12s. 6d.—Office: 175 Strand, London, W.C.

THE Birmingham City Council have approved of the recommendation of the Museum and School of Art Committee to expend 630*l.* in the provision of a new staircase and extending the iron gallery around the industrial hall of the Art Gallery. The Public Works Committee were authorised to arrange for the construction of a storm-water conduit, for the relief of sewers in Ladywood Ward, at an estimated cost of 4,875*l.*, and for additional stabling, granaries, &c., at the Holliday Street Wharf, at an estimated cost of 6,000*l.*

THE Coventry City Council have approved of the recommendation of the Estates Committee for the extension of the County Lunatic Asylum at Hatton. Mr. Edward Mansell, architect, of Birmingham, approximately estimates the cost of the necessary works at 30,360*l.* To this there must be added a sum, which the Visiting Committee estimate at 7,500*l.*, to cover heating and ventilation, architect's commission, wages of clerk of the works, and extras—38,000*l.* in all.

IN regard to the proposed infectious hospital for Leith, Mr. Simpson, architect, has reported as follows:—"I understand the remit to refer to the erection of all the buildings, &c., shown upon the plans, with the exception of two ward pavilions. (1) The estimate of the probable cost of constructing the hospital according to the sketch plans submitted was stated in my report of the 11th ultimo (April) to be for constructing the hospital of stone, 28,800*l.* By not erecting two pavilions at present the reduction would be about 5,110*l.*, leaving probable cost of restricted buildings, &c., to be, if erected with stone, 23,690*l.* (2) Estimate for stone, as above, 23,690*l.*; less, if buildings are erected with common brick, 1,800*l.*—making cost of restricted buildings, if brick, 21,890*l.*" The committee instructed Mr. Simpson to complete his plans for all the erections in connection with the proposed hospital, with the exception of the two pavilions, and to advertise for alternative estimates for the construction of the buildings in stone or brick. The Town Council have adopted the committee's recommendation.

FIBRE FROM THE DWARF PALM IN ALGERIA.

THE *Scientific American* has an article on the above as follows:—The dwarf palm, which furnishes considerable quantities of fibre, grows in great profusion in Algeria, and is one of the principal obstacles to the clearing of the land, so thickly does it grow and so difficult to pull up; its roots, in shape resembling carrots, penetrate into the ground to the depth of a yard or more, and when its stem is only cut it sprouts out again almost immediately. As its name indicates, this palm is very small, and can only attain a certain height when protected, as in the Arab cemeteries, for example.

Various uses are made of this plant. Its roots serve as combustibles, a light kind of coal being made out of them, and the natives have employed the fibres that they extracted from the leaves and the stems, mixed with camel hair or wool, in the manufacture of stuffs for tents; with the leaf itself they make baskets, mats, hats, fans, bags, and other articles. Considerable attention is now being paid by the authorities to the encouragement of this industry in Algeria, as, in the first place, it affords to the Arabs an easy means of making a living, and, in the second, the land is thus rapidly cleared of this parasite. The idea of embarking in the industry of fibre production from the dwarf palm originated a few years ago with a landed proprietor living in Cheragas, about eight miles from Algiers. At the present time there are in Algeria numerous establishments which are devoted to this branch of industrial enterprise. The principal factories are those of Aversing, Elaffroun, Chiffa, Duperre, and Douera, and the exports of late years have exhibited a decided increase. In 1880 the quantity of fibre exported from Algeria amounted to 9,000,000 kilogrammes, in 1885 to 15,000,000 kilogrammes, and in 1891 to 19,000,000 kilogrammes.

In preparing the fibre, the following is the system adopted. The leaves are plucked by the Arabs and carried into the courtyard of the factory in a green state, at a price of twenty francs per ton. As they are at once used, and as they fear neither the rain nor the sun, it is only necessary to pile them on the floor in a heap. The first operation consists of sorting, which is effected by women and children. The weeds are removed from the stems which frequently adhere to them, and the broken or dried-up leaves are cut away. Another operation consists in combing the leaves, or rather in carding them. This is effected as follows: A workman holds tightly in his right hand a handful of green leaves which he applies to a

JAMES HILL & CO., 100^A Queen Victoria Street, London, E.C.

small carding machine. This machine consists of a drum on which some nails have been roughly fixed, and is constantly turning with great rapidity. To protect the hands of the workman it is incased in wood, with only an opening sufficiently large to admit the leaves. As it is necessary that these leaves should be damped during the work, a tap is placed above the drum, from which a constant stream of water falls upon the leaves. With this most primitive system a workman is able to card from five to six hundred kilogrammes—1,000 to 1,300 pounds—of leaves a day.

When the leaves have been combed at both ends they present the appearance of a handful of rough and short fibre. They are then dried, and after certain preparations are ready for use in stuffing chairs, couches, &c. To curl the fibre, a workman takes up a quantity of carded leaves and applies it to a bent hook fixed upon the axle of a wheel, which is turned by a child. The first fibres accumulate round the hook, and wind themselves round it; the latter, which is constantly turning, draws in the others, and the workman recedes from the wheel while grinding the fibres with his hand. The latter soon constitute a sort of cord, one end of which is fixed to the hook, the other held firmly and horizontally by the workman. At this stage of the proceedings the child who turns the wheel stops and detaches one extremity of the cord, which he returns to the workman, after having passed it round the hook. In this operation the cord is subject to the natural impulse of twisting, and rolls up on itself, so that it is only necessary to fix the ends so that it cannot come unrolled. The fibre is kept in this condition for several weeks, and is then untwisted, and is then considered to be sufficiently curled. African fibre is employed in its natural state or dyed. In the latter case the fibres are passed through various solutions of sulphate of iron and logwood, then curled, and again plunged into the solution.

DEFECTIVE DRAINS.

ON Tuesday, in the Queen's Bench Division—before Justices Mathew and Wright—the case of Levenberg v. Wykes came on for hearing. It was an appeal by the defendant, an architect, from the judgment of the County Court judge at Birmingham after the finding of a jury. The defendant was architect of some houses built in Portland Road, Edgbaston, in 1878, and plaintiff's case was that last year, when there was a nuisance on the premises and the drains were opened, it was found that they had not been constructed in accordance with the plans

deposited with the local authority. An action was therefore brought against the defendant for fraudulently representing that they had been so constructed, and the jury found a verdict for the plaintiff.

Mr. Hugo Young, for defendant, now contended that there was no evidence on which the jury could so find, that defendant had made no representation as to the drains, and that he had altered them in the exercise of his discretion under the contract.

Mr. Turrell, for the respondent, urged that the verdict of the jury must stand, as there was ample evidence on which they could find as they had done.

Mr. Justice Mathew, in giving judgment, said the sole question for the Court was whether there was evidence in the case on which the jury could reasonably find as they had done. He was satisfied that there was that evidence, and he was also satisfied that the learned judge, in his summing up, told the jury the law with great clearness. In fact, he represented the case in such a way that the jury, if they were disposed to take a favourable view of the defendant's conduct, had an opportunity of doing so, but they considered that the plaintiff had made out his case, and so found.

The appeal would be dismissed with costs.

Mr. Justice Wright concurred.

MANCHESTER SHIP CANAL.

THE opening of the Ship Canal to Manchester being so near, the particulars given by the *Manchester Guardian* with reference to the height of the fixed bridges over the Ship Canal may be of interest. Between the entrance at Eastham and Runcorn Bridge (about twelve miles from Eastham) it will be possible for the largest vessels to navigate the Ship Canal provided they have a breadth not exceeding 80 feet—the width of the largest of the three locks at Eastham. A Liverpool writer was in error in stating recently: "It will rather dwarf the importance of the Manchester Ship Canal as a highway for the carriers of produce from beyond the seas when it is known that the funnels of the new Cunarder *Campania* could not possibly pass under the Runcorn Bridge, let alone her masts. Each of these funnels, it is said, is higher than the Eddystone Lighthouse." The funnels of this vessel are about 120 feet high, while the Eddystone Lighthouse is 170 feet high. There is only one dock in Liverpool into which the *Campania* could enter, and that only on a spring tide at high water. It will not, therefore, "dwarf the importance of the Ship Canal" if

such large vessels as the *Campania* (620 feet long and 65 feet broad) and the largest of the American liners "cannot possibly pass under Runcorn Bridge," as the bulk of the "carriers of produce from beyond the seas" are steamers or sailing vessels having a less draft than 22 feet, a length of less than 500 feet and a breadth not exceeding 46 feet, the funnels of which steamers do not reach anything like the height of Runcorn Bridge and the other fixed bridges over the canal. Each of these allows a clear headway of 75 feet above ordinary water level. The masts of such vessels can be lowered when entering the canal, so that there will be no difficulty in their traversing the whole length of the canal to Manchester. The advantage of being able to navigate the canal has been, and is still being, found by shipowners and shipbuilders to be so great that their vessels are now being built with masts that can easily be adjusted to pass under all the bridges on the canal. Vessels bringing timber whose masts would not allow them to go past Runcorn Bridge can discharge their cargoes outside into the extensive timber pond at Saltport and take on board salt or coal, &c., for export. South Yorkshire coal, which is much used for bunkering steamers, can be brought into the Ship Canal direct from the Barnsley and other collieries in barges for bunkering at much less cost than at present. Pit-props and other timber are very largely used in the collieries of Wigan, Leigh and other towns in South Lancashire connected with the Ship Canal by smaller canals, and the barges taking such timber could easily bring back coal for export. It certainly does not appear that the Ship Canal will lose much for the seeming difficulty with respect to masts. The steamship *Wensleydale*, 1,160 tons register, one of the Knotts Prince Line of steamers, is a vessel of about the size which will use the Ship Canal to an enormous extent as soon as it is opened to Manchester, without much difficulty in respect of the bridges. There is no reason why steamships such as the following should within a few months have any difficulty in navigating the Ship Canal to Manchester and Salford:—*Cufic* (White Star Line), 4,639 registered tonnage; *Ottoman* (British and North Atlantic Steam Navigation Company), 4,843 registered tonnage; *Columbian* (Leylands), 5,038 registered tonnage; *St. Ronans* (British and Foreign Steamship Company), 4,457 registered tonnage; *Pavonia* (Cunard Line), 5,588 registered tonnage; *Germanic* (White Star Line), 5,008 registered tonnage; *British Princess* (British Shipowners' Company, Limited), 3,936 registered tonnage; *Philadelphian* (Philadelphian Steamship Company), 5,120 registered tonnage.

EDINBURGH CASTLE.

As has been already mentioned, the War Office has resolved to convert the Ordnance Stores at Edinburgh Castle into a hospital for the men of the garrison—the old Parliament Hall, now so happily restored, having been previously used for that purpose. When in London lately the Lord Provost had an interview with the authorities of the War Office, and urged upon them the propriety of their using the 2,000 $\frac{1}{2}$ the Government is to receive from the North British Railway Company for the ground at the foot of the castle slopes (which is leased to the Corporation) to improve the appearance of the buildings on the castle, some of which are far from creditable to the reputation of the city for style, or worthy of the commanding position they occupy in the eyes of all men. In any case his lordship expressed the hope that nothing would be done in connection with the proposed hospital to add further to the disfigurement of this site. The Lord Provost also saw General Lyon-Fremantle, commanding the Scottish District, and the General, who was good enough to interest himself in the matter, wrote to the war authorities on the subject. The Lord Provost a few days ago received from General Lyon-Fremantle the following copy of a letter which had been sent to the General from the Inspector-General of Fortifications:—

War Office, London, S.W. : May 23, 1893.

Sir,—With reference to your letter of the 30th ultimo respecting the conversion of the Ordnance Stores at Edinburgh Castle into a hospital, I am directed by H.R.H. the Commander-in-Chief to acquaint you that the 2,000 $\frac{1}{2}$ compensation referred to will not be receivable by the War Department, but that it is understood that it will be paid to the Office of Woods and Forests.

The Secretary of State for War sympathises with the view of the Lord Provost of Edinburgh as to beautifying the castle, and only regrets that the small amount of the funds available for War Department purposes enables so little to be done in this direction.

Mr. Secretary Campbell-Bannerman has, however, caused a letter to be addressed to the Office of Woods and Forests asking whether that Department would be prepared to assist in the matter.

I am to request that the Lord Provost may be informed accordingly.—I have the honour to be, sir, your obedient servant,

(Signed) R. GRANT,
Inspector-General Fortifications.

In the circumstances, the Lord Provost has, we believe, put himself in communication with the Department of Woods and Forests, and has, at the same time, addressed a letter to

the four city members detailing the circumstances of the case, and asking their co-operation in the matter. His lordship, we believe, the *Scotsman* says, is prepared, should the Woods and Forests Department agree to spend the 2,000*l.* in the way suggested, to ask the Town Council to make a contribution to a fund for improving the amenity of the castle buildings, and also to invite the co-operation of the citizens in furthering what will be felt by all to be a very laudable object.

NEW MISSION HALL, BOLTON.

THIS building, of which the foundation-stones have been laid, is designed of a perfectly plain but substantial character as to the erection. Provision is made in the basement for a large gymnasium 61 feet by 65 feet, which is lined with brown glazed bricks 4 feet high. Two large labour rooms are also arranged, 57 feet by 30 feet and 26 feet by 44 feet respectively. Two bathrooms are provided, lined with best brown glazed bricks and fitted with baths of the best kind. A soup-kitchen with steam boilers, a kitchen and heating-apparatus room complete the accommodation in the basement. Three entrances are provided to the same from the street's level.

On the ground floor is the large hall, 66 feet by 44 feet, with open pitch-pine roof, and with pitch-pine boarded dado 4 feet high all round. A gallery is also arranged at one end to accommodate about 180 persons, and the body of the hall will hold about 600. On this floor there are also a large infants' room, with gallery, and four classrooms of various dimensions, two of which can be opened to the hall by means of revolving shutters, so as to provide additional space when desired at public gatherings. A private office and the entrance, staircase, &c., with the requisite lavatory accommodation, complete the provision on the ground floor.

On the upper floor is one large classroom, 24 feet by 32 feet, and seven other classrooms of various dimensions. The gallery in the hall is entered at this floor level.

The building will be heated with hot water, and the lighting and ventilating will be carefully attended to, and will be a combined scheme. The woodwork throughout is of pitch pine, and the exterior is faced with patent bricks with stone dressings. The contractors for the work are:—W. Kearns, excavator; J. Merrick, bricklayer; A. W. Kenyon, joiner; R. Walsh, plumber; A. Warburton, plasterer and painter; Gregson &

Smith, masons; and J. Hodson, slater. Mr. W. J. Morley, F.R.I.B.A. (late Woodhouse & Morley), is the architect. The total cost of the building and site will be over 4,000*l.*

BUILDERS' LABOURERS.

IN connection with the decision of the Bedford bricklayers and labourers to strike, a labour meeting was held on the 26th ult. Rev. P. Wyatt, who spoke, said he was persuaded—and he did not know what the builders would say to this—that there were too many of them in Bedford and that they were under-cutting each other. Then a singular fashion, a moving fashion, had done a good deal of mischief. Those who had been in the town a good many years knew that certain land became the fashion, instantly there was a rush to it, the land was consequently at once put up to a fictitious value, the builders secured plots and built houses, and then the fashion went. This was the case with Ashburnham Road, the Embankment, Beckett Estate, De Parys Avenue. The builders could not possibly stand against this, as they had to give more than the property was worth, and then found the houses on their hands. They had all noticed that those engaged in the building trade had a tremendous fancy for most ornamental tiles and extraordinary terra-cotta things. This was an unconscious joke on the part of the architects, because these fancy tiles suggested that "monkey" which was one of the most fruitful sources of the mischief in the building trade at the present time. He did not mean to say that it was possible for anyone to go on without mortgaging their works. The rates of Bedford had to be mortgaged for municipal purposes, but mortgaging in general he looked upon as one of the most disastrous things in the trade. He thought the claim of the labourers was a just one. Although undoubtedly labourers were in possession of little luxuries which their grandfathers would not have dreamt about, still labour was not—and he would adhere to this if half England contradicted him—receiving its due share of that great increase of the national wealth and of those great privileges which had almost entirely been sucked in, not only by the great wealthy classes, but by the middle classes of England. But, honestly, he thought it was a very difficult time to endeavour to enforce their claim. The building trade was not now in the flourishing condition it had been in during the last five years. He was not one of those persons who went in for the parrot-cry that the

town was over-built. It never had been, but from the present state of the town, and the fearful financial collapses we had had lately, it appeared that the trade must be checked very considerably for the next eighteen months. The gist of the whole question was, could they enforce their claim? Turning to another question, upon which he hoped he should not give offence to the builders, he asked if it was not a fact that many builders employed a great deal of labour from the villages. We all rejoiced in the fact that a man was able to live in the village and yet take part in the work of the town—and this chiefly through the aid of the cycle—but no builder had any moral right to pay village labour less than town labour. Let the workman from the village, who had his extra walk or ride, give his services for absolutely the same wages as the townsman. This was real co-operation of labour, real pulling together, and if it were done there would be no danger of importation of labour. But, just as their demands were, he did not think the present was quite the time to enforce them; and he would advise them in the meantime to earnestly set themselves to work to join some Union, so that when the happy time came when the demands for labour were strong and definite, there could be no mistaking them.

JERRY BUILDING.

THE *Standard* says:—The persons most directly to blame for the growth of jerry building are its victims. The London householder—and it is with the Londoner we are at present dealing, though the provincial is not blameless—is anxious to obtain a nice-looking house for less money than it can honestly be erected for. And the jerry builder appears—the *diabolus ex machina*—to supply the cheap and worthless article demanded. He is the public benefactor who rears these long suburban streets of houses all exactly the same, and displays such avidity, not to let them, but, for obvious reasons, to sell them. The architect has supplied a single plan, and, it is needless to say, can afford little time to superintend its endless multiplications, even if he was asked to do so. The speculative builder has generally little if any capital, and is trading entirely on advances—first from the freeholder of the land on which his creations appear, then from the brick and timber merchants, and, lastly, from the local bank, which claps a mortgage on the houses as soon as they are roofed in. To pay the interest on all these loans requires him to shave at every turn, and to sell,

or failing that, to lease his speculations very speedily if he is not to make an explanation of the financial mysteries of his craft before a commissioner in bankruptcy. And to let or sell his showy houses he must appraise them at "times prices," and even then comes out of the transaction with the least profit of all the parties who have indirectly had their hands in the householder's pocket. The truth is that a dwelling-house of the best kind is a very complicated piece of mechanism, the quality of which few people are capable of judging, and still fewer care or can afford to indulge in. But hosts of tenants are perfectly well aware that they are entering jerry-built mansions. They do not wish an ancestral home, it is argued, but a villa which will look well for three years, or, if of the higher order of the jerry style, for seven, fourteen, or twenty-one years. There are plenty of good houses in London, but they are either old-fashioned or too dear, and not pretentious enough for the money. It is immaterial to this class of customer whether the house is well or indifferently built. He believes it will last out his tenancy, though in this hope he is occasionally undeceived, and assuredly his successor will be. Moreover, the ordinary suburban resident is one of a migratory tribe. He seldom stays more than five or six years in the same locality, his period of decorous encampment being determined by the life of a cheap Brussels carpet. Then, metaphorically, he folds his tent like an Arab, and, as the local tradesmen occasionally bewail silently steals away. This habit the jerry builder has observed and ministers to.

AGRICULTURAL SHOW, GLOUCESTER.

MESSRS. MERRYWEATHER & SONS, who have undertaken, as in former years, the entire protection of the show buildings from fire for the Bath and West of England Society, had a handsome fire-station in the grounds. Capt. J. H. Cleaver, with a staff of trained firemen, had charge of the powerful fire-extinguishing apparatus. The plant available included a powerful double-cylinder "Greenwich" steam fire-engine, capable of throwing 360 gallons of water per minute and of raising steam in from six to eight minutes from time of lighting the fire. This engine is similar to those in use in the London, Liverpool, Manchester, Wigan, Hull, Bedford, Nottingham, Eastbourne, Wimbledon, Portsmouth, Bath, Salisbury, and many other brigades. The engine would be turned out by Messrs. Merryweather's staff day and night in case of a fire occurring in the show buildings, and some idea of its power

GRINNELL

The Sensitive Automatic

GRINNELL SPRINKLERS are at present protecting 15,000 Buildings in all parts of the World, including Theatres, Shops, Warehouses, &c.

1,300 FIRES have been Extinguished by the GRINNELL at an average loss of £55 PER FIRE.

ARCHITECTS should SPECIFY for GRINNELL SPRINKLERS for Theatres, Clubs, and Public Buildings. They can be erected in Mansions without disfiguring the appearance of the rooms or ceilings.

may be gained from the fact that it will throw a solid jet, one and one-eighth inch diameter, to a height of 160 feet, or as many as six smaller jets if required. The next engine, the celebrated "Squires" engine, has proved itself useful on many estates during the recent drought for watering crops, fruit trees, &c. The "Squires" engine consists of a light portable driving engine, provided with a pump which can be thrown out of gear when required, and a fly-wheel on which a belt can be placed to drive electric lighting, threshing, grinding, churning, separating, deep-well pumping or other machinery. The pump will deliver 160 to 200 gallons of water per minute for fire extinguishing, water-supply or irrigation purposes, and the engine will develop from six to ten horse-power as required. A handsome "London Brigade" manual fire engine was fitted with Merryweather's new patent gun-metal valve box and breeching, as well as with other improvements which render it capable of delivering a much more powerful stream of water than the ordinary pattern. A "Universal" pattern manual suitable for irrigation or fire protection, a handy barrow-pump for similar purposes, hose-reels, "Tozer," "Corridor," "London Brigade" and other Merryweather hand fire-pumps were provided, as well as a full equipment of hose and gear for each. A number of these hand fire-pumps were placed in various parts of the buildings with buckets of water ready for immediate use in case of fire.

Messrs. Crossley Brothers, Limited, Openshaw, Manchester, had a much larger exhibition than usual, having six of their well-known "Otto" gas-engines running at 25 nominal horse-power with the new patent starter attachment, with which they can start the engines with half the load on, a 9 horse-power, a 3 horse-power, a 1 horse-power, a new type $\frac{1}{2}$ horse-power vertical engine which is exhibited for the first time, a new-type $\frac{1}{2}$ horse-power high-speed horizontal engine driving a dynamo, and one of their new patent 4 horse-power oil gas-engines driving a dynamo.

Tangye's, Limited, of Birmingham, had a magnificent show of gas-engines on the "Otto" principle, all in rapid motion, and the novel mechanism upon which they are constructed made the exhibit one of peculiar attractiveness. The high value which attaches to the machinery is emphasised by the fact that Tangye's, Limited, received a gold medal and other distinctions at the principal exhibitions. The Duke of Westminster and other distinguished personages are using these gas-engines, and have testified to the satisfactory manner in which they work.

PUBLIC WORKS IN HARROGATE.

At the meeting of the Association of Municipal and County Engineers held at Harrogate, Mr. S. Stead, the borough engineer, read a paper on "Municipal Work in Harrogate." He mentioned that the area of the borough was 1,287 acres, and the rateable value was about 92,000 £ . The general district rate was 3s. 2d., the borough rate 2d., and the poor rate 1s. 4d. in the pound. The management of the town was in the hands of the Improvement Commissioners from 1841 until 1884, when the borough was incorporated. The bulk of the sewage was delivered by gravitation on to an irrigation-farm of 310 acres situated just outside the borough boundary. When the farm was originally laid out the sewage was passed through a number of settling tanks, but this was not found to work well, and the sewage now passed in its crude state on to the land. The annual loss upon the working of the farm was about 150 £ , and 1,350 £ for sinking fund and interest, making a total of 1,500 £ . The ordinary dry-weather flow of sewage was about 320,000 gallons per day. The whole of the public streets within the borough were macadamised. It was estimated that the total length of the public roads and streets was about twenty miles, of which four miles were under the control of the West Riding County Council. Limestone from a quarry at Pateley Bridge was used for the tar macadam. The tar was purchased from the Harrogate Gas Company. The ashes for firing the rough or foundation material were got from the ordinary domestic ashpits. The limestone was broken to a 2 $\frac{1}{2}$ -in. gauge, and spread upon the ground in a heap about 6 feet wide, 15 to 18 inches high and any convenient length. A fire was then lit on the top, and the stones gradually turned over and mixed until all were at the same temperature. The stone was afterwards spread on an iron plate while warm and thoroughly mixed with gas-tar, after which it was stacked in a heap ready for use. The materials were much improved by stacking for a few months before being put on the roads. The streets were laid out at widths of 12, 15 and 20 yards, according to their importance. When villa residences were built detached or semi-detached, the drainage was usually into the front street. During the four and a half years he had been surveyor the average number of houses built per annum had been about 200. The gas supply was in the hands of a private company, from whom the Corporation purchased the gas used for the lighting

of the street lamps, and paid for it at the rate of 2s. 8d. per 1,000 cubic feet. There were at present 564 public lamps in the borough. The Corporation had had the subject of electric lighting under consideration for some years past. In 1891 they obtained a provisional order empowering them to lay down the necessary plant to supply electricity within the limits of the borough. Since that time the Electric Lighting Committee of the Corporation had made careful inquiries, and had visited towns where installations had been laid down. They had also obtained advice on the subject from an expert. They were now advertising for tenders to do the necessary work for them. The water supply of the town was in the hands of a private company. The bathing establishments were the property of the Corporation. The Victoria Baths were erected in 1871 by the Board of Commissioners at a cost of about 30,000l. Additions and alterations had been made from time to time to these baths, in order to meet public demands. The Montpellier estate had been purchased from the representatives of the late Ald. George Dawson for 29,500l., and upon it were to be erected new baths, at a cost of between 40,000l. and 50,000l. The work would probably be commenced before the summer was over. At one time the lower portion of the town was liable in stormy weather to be flooded, owing to the lack of proper means for carrying off the storm water. To remedy this, parts of the old culverts had been enlarged. The open-ashpit system had been in vogue in Harrogate in the past, but the Corporation were now endeavouring as far as possible to replace these by movable galvanised iron dust-bins with covers. Formerly the removal of domestic refuse was left to individual householders, but last year the Corporation undertook this work, and the change had been attended with satisfactory results. Twelve underground tanks had been erected in which to store sulphur water, and these were capable of holding about 30,000 gallons.

Mr. Dixon, the waterworks engineer, read a paper on the "Harrogate Waterworks." All the attractions of Harrogate, he said, must have been deprived of much of their interest had it not been for the plentiful supply of water which the town enjoyed. The very wells for which it was now so famed rendered Harrogate some years ago all but destitute, the water from the wells and springs being so impregnated with extraneous ingredients as to make it quite unfit for domestic use. The town now received its water supply from the moorlands. The gravitation works were about five miles to the west of Harrogate. The company first obtained power to supply the

borough by an Act of Parliament in 1846. Owing to the scanty population of the district the first works erected were necessarily small. In 1861 the company had only 336 customers, while now they had 3,357. During the last ten years the population had increased rapidly, for while in 1881 only 109,000,000 gallons of water were used, the yearly consumption now averaged about 225,000,000. Mr. Dixon then went on to describe in detail the Ten Acres reservoir, the Harlow Hill service reservoir, the Beaver Dike reservoir, and the additional service reservoirs at Irongate Bridge. A constant supply was maintained in the town under pressure varying from 20 to 100 lb. to the square inch.

VENTILATION OF A BOARD SCHOOL.

THE system of heating and ventilation at the new Board School, Wheatley Street, Coventry, has been carried out by Messrs. Jackson & Son, heating and sanitary engineers, of Moor Street, Birmingham. The authorities have recently tested the system, and, judging by the report, are more than satisfied with the system.

On Friday, the 26th ult., Dr. M. A. Fenton, medical officer of health for Coventry, made an inspection of the ventilating apparatus of the Wheatley Street Board School, which has been supplied by Messrs. Jackson & Son, heating and ventilating engineers, Birmingham. There were also present during the inspection, in addition to the doctor, the Mayor of Coventry (Alderman G. Singer), the chairman of the School Board (Mr. J. Atkins), Mr. Caldicott, Mr. E. Brown (librarian at the free library), and Mr. Davies (clerk of works). Everything in connection with the system gave the fullest satisfaction. Dr. Fenton expresses the opinion that it is a most excellent one. Ventilation is a most difficult problem to deal with in respect to large schools, but at Wheatley Street it is believed the most efficacious system has been introduced. In the basement of the building is a very powerful fan, which sends 1,000,000 cubic feet of fresh air per hour into the building, there being also outlet shafts to take away the impure air. This quantity of fresh air, it will readily be admitted, should prove sufficient to keep the atmosphere of the rooms absolutely pure, and this is naturally the great desideratum. The following is a detailed description of the work at Coventry:—

The schools consist of ground and first floors, with large

assembly hall upon first floor, and covered playground under assembly hall.

The heating is by a low-pressure hot-water apparatus, and power is derived from two large Trentham Cornish boilers fixed in basement, circulating pipes being carried from boilers through a series of air-flues under ground to recesses in the windows of the rooms upon each floor; in each window recess is fixed a large coil of hot-water pipes; large coils of hot-water pipes are also fixed in three recesses in assembly hall. Valves are fixed upon each coil to regulate the supply of heat.

The ventilation is effected by mechanical means. Fresh air is taken in at a large shaft several feet above the ground-floor level, and after passing through a screen to free it from dust, &c., is driven by a large fan along the various air-flues under the ground floor, and enters each classroom upon the ground and first floor under the windows. The air in cold weather is warmed by means of the low-pressure hot-water pipes fixed in the various air-flues, and the coils of pipes fixed in the recesses under the large windows in each classroom, and also in the three recesses in the assembly hall. In the summer time the rooms are ventilated by the same means, except that the air is allowed to enter unwarmed. The air is thus forced into each of the classrooms, corridors, &c., is driven out by the same force up extract shafts from openings near the floor level in each room on the opposite side to that at which it enters, and then into the main exhaust air-trunks in the roof, which are connected with the tower, and so passes away. For summer ventilation openings are provided in each room near the ceiling. The fan is driven by a powerful gas-engine, and is so regulated as to change the air in the whole of the building three times per hour, this being equal to passing 930,000 cubic feet of fresh air through the schools each hour the apparatus is working. A temperature of 60 to 65 deg. is maintained in each of the rooms during the winter months with the constant change of air as before-named.

REGISTRATION OF PLUMBERS.

THE annual conference of the district councils for South Wales, in connection with the national registration of plumbers, was held at Swansea on Saturday. Dr. Morgan, public analyst, presided, and there was a good attendance of representatives of the public and the plumbing trade of the district. Mr. Glendinning Moxham, architect, of Swansea, read a paper on "Sanitation and the Sanitary Education of Plumbers," and

after full discussion the following resolution was passed:—"That it is desirable in the opinion of this conference that all sanitary and plumbing work should be carried out under the direct supervision of some person or persons who shall be held directly responsible for the faithful completion of the work, and that this conference submits that registered plumbers are better qualified for that position than any other members of the building trades."

PATENTS.

[This List of Patents is compiled specially for this Journal by Mr. G. H. Rayner, of the firm of Rayner & Co., Consulting Patent Agents, 37 Chancery Lane, London, W.C., from whom all particulars and information relating to Patents may be had gratuitously.]

APPLICATIONS FOR PATENTS.

10165. John Nicol Mitchell and William Morrison, for "Improvements in and relating to open or close fire-stoves, grates or cooking-ranges."

10173. John Alexander Steven, for "Improvements in and relating to hydraulic lifts."

10292. Chester M. Bates and Horace C. Lutz, for "A combined elevator and carrier."

10312. William Stewart Halley and John Best, for "Improvements relating to gas-stoves, ranges, and the like."

10315. Joseph Wilson, for "An improved chimney-top."

10344. Henry Harris Lake, for "An improved combined pneumatic door-check and atomizer."

10345. Cesar Müller, John Franz Frederick Brinckmann and Hermann Luban, for "Improved means and arrangements for protecting the hollow iron parts of buildings against the action of fire."

10390. Louis Joseph Tiraud, for "Improvements in fire-alarms."

10426. Edward Collier and Richard Collier, for "Improved means for securing door-knobs to their spindles."

10470. Joseph Armytage Wade and John Cherry, for "An improved centrifugal machine adapted for use as a pump, blower, or exhauster."

Terra-cotta.

VARIETIES.

THE eleventh annual exhibition (Cassell's Black and White Exhibition) has been opened at the Cutlers' Hall, Warwick Lane, Newgate, and will remain open till the 29th inst.

A REPORT on the Leamington borough water supply has been drawn up by Mr. H. Howell for the Town Council. Mr. Howell expresses the opinion that there should be no fear that the present supply will prove insufficient in ordinary seasons; but, in view of the possibility of a succession of dry seasons, and the tendency shown by consumers to waste water when it is not supplied by meter, he recommends an extension of the

system of driving underground adits so as to increase the supply, and that a new well be sunk between Lillington and Cubbington.

THE docks at Runcorn, which have been closed twelve months, have been reopened for traffic, the portion of the Manchester Ship Canal between Weston Point and the Bridgewater tidal dock having been completed. The water was admitted into the new waterway two or three weeks ago, but since then the deepening of the Bridgewater lock has been going on, and this having been finished now, it is found possible to recommence dealing with the traffic on the same lines as before.

At the meeting of the Motherwell Commissioners, Provost Colville presiding, it was agreed to borrow 7,000*l.* for the drainage, causewaying and hospital works of the burgh.

MR. BALDWIN LATHAM, who was engaged as an expert engineer to report to the Shipley Local Board as to the disposal of the sewage of their district, has sent in his report, and estimates his scheme to cost 32,000*l.*, and the working expenses at 1,531*l.* a year. This alone would entail a charge of 6*d.* in the pound on the rates, and the interest and sinking fund would mean another 6*d.* in the pound.

THE Chapel-en-le-Frith Rural Sanitary Authority have instructed Mr. W. H. Radford, C.E., of Nottingham, to prepare a scheme for the sewerage and sewage disposal of Castleton in their district.

THE Sewerage Committee of the Wolverhampton Town Council recommend that their newly-acquired land be under-drained, and that other work be executed at the Barnhurst Farm at a cost of 10,200*l.*, and a loan obtained for that amount. The Public Works Committee recommend that certain streets be paved with granite setts, at a cost of 8,951*l.*, and that the Finance Committee be authorised to obtain a loan of 9,000*l.*

A TRURO paper says:—Rumours are being circulated to the effect that the Poltisco Serpentine Works at Ruan, near Helston, which until lately have been carried on by Mr. Jabez Druitt, and which were offered for sale a few days ago, have been inspected by a prominent architect, a builder, and an iron-founder of the county, with a view to being worked as a limited liability company.

IN a letter to the *Times* Mr. R. B. Marston says:—The roadway of Waterloo Bridge is made of stones which are so smooth and slippery that even when perfectly dry or slightly

wet horses are always falling. Not only carelessly-driven hansom horses going fast, but heavy waggon horses will suddenly fall even when going at a walking pace. It is manifestly impossible for a smooth iron horseshoe to get a sure hold on smooth polished granite.

THE plans submitted by the Central London Railway Companies in regard to the proposed Central Station at the Mansion House have been approved by the City Commissioners of Sewers. The plans show seven staircases, connecting with the subways and the railway station. The principal access to the subways will be by two staircases on the western front of the Royal Exchange—one at Threadneedle Street and the other at Cornhill—and a third at the junction of Queen Victoria Street and the Poultry. There will be two staircases at the corner of Princes Street, one in Mansion House Place and one in Walbrook. The staircase abutting against the Bank has been abandoned. Considerable areas would be taken out of the public ways for the staircases. These, however, would provide subways for pedestrians and openings to the railway station.

ELECTRICAL.

At the meeting of the Coatbridge Dean of Guild Court linings were granted to the Scottish House-to-House Electricity Company, Limited, to erect works for the supply of electricity in the burgh at Henderson Street.

A JOINT committee of the two Houses of Parliament, presided over by Viscount Cross, sat on Monday, the 12th inst., to consider whether the grant of statutory powers to use electricity ought to be qualified by any prohibition or restriction as to earth return circuits, or by any provision as to leakage, induction or similar matter, and, if so, under what conditions. Sir Theodore Martin asked that the parties interested might be heard before the committee through counsel. After consultation in private, the committee decided to hear counsel on behalf of the following bodies:—(1) The railway companies; (2) the National Telephone Company; (3) the tramways and electric railway companies; (4) the electric lighting companies; (5) the English and Scotch municipalities and the London County Council. The committee arranged to meet on the following Monday, and in the first instance to take the evidence of Sir Courtenay Boyle on behalf of the Board of Trade.

At the meeting of the Watch Committee of the Worcester City Council the Electric Lighting Sub-Committee recommended the employment of Mr. W. H. Preece as engineer, to supervise the execution of the electric-lighting works, at a commission of 2½ per cent. on the amount of the Brush Company's contract—20,000l. This was adopted.

THE arrangements for lighting Rugby School with electricity have been completed, and the work of laying down the generating plant is being proceeded with. The boarding-houses, sanatorium, art museum, gymnasium and the whole of the school will be lighted, and about 15,000 incandescent lamps will be used. It is estimated that the cost will be at the rate of 4d. or 4½d. per Board of Trade unit, which is equivalent to gas at 3s. 6d. per 1,000 cubic feet.

THE report of the Lighting Committee of the Wolverhampton Town Council states that Mr. F. H. Harman, of Hull, has been appointed electrical engineer to the Corporation at a salary of 300l. per annum; and Mr. A. P. Brevitt, of Wolverhampton, has been appointed architect to prepare plans and specifications of the necessary buildings in connection with the scheme.

BUILDING AND BUILDERS.

PLANS have been prepared by the county surveyor for a new police station to be erected at Cradley, at a cost of 3,000l., for the Worcestershire County Council.

At the meeting of the Burslem Town Council the Baths Committee recommended that the building of the baths should be proceeded with at once on the site in Moorland Road, that the amended tender of Mr. William Cooke for the erection of the baths for the sum of 7,958l. be accepted and application made to the Local Government Board for sanction to borrow 9,000l. for the purpose.

THE *Blackpool Times* says:—Mr. Herbert Wade, architect, of St. Annes, has just got out plans for Mr. Riley for the first houses at Fairhaven. The marine drive, along the Stanner, has now been formed beyond the bridge in the direction of St. Annes. About 100 workmen are engaged, beside a couple of steam diggers. Mr. Giffen succeeded the late Mr. James Riley in the superintendence of the work as engineer. Mr. Carter fulfils the post of surveyor.

It is proposed to erect and furnish a hospital at a cost of 3,000l. at Orsett, to jointly serve that borough and Horbury.

ON the recommendation of the Technical Instruction Committee the Widnes Town Council have decided that, subject to the sanction of the Local Government Board being obtained to the borrowing of the money, the following tenders be accepted:—For the erection of technical school and free library combined, Mr. Isaac Dilworth, Wavertree, 8,130*l.*; and for supply of Dennis Ruabon terra-cotta, Messrs. Dennis & Co., Ruabon, per Mr. John R. Lea, 875*l.*

THE Leyton Local Board have decided to erect parochial offices on land adjoining the present building.

TRADE NOTES.

NEW hospitals, East Poorhouse, are being erected at Dundee for the Dundee Parochial Board, from the plans of Mr. W. Alexander, architect. The whole of the wards are being warmed by Mr. E. H. Shorland, of Manchester, by means of his patent open fireplace Manchester stoves with ornamental tiled sides and backs and with descending smoke flues.

THE Yost typewriter has gained another gold medal in Paris, the occasion this time being the exhibition under the auspices of the Académie du Progrès Nationale. This makes the fifth gold medal and the sixth highest award granted to the Yost typewriter, which has carried off the highest honours wherever it has been exhibited.

THE Gas and Water Committee of the Widnes Town Council recommend that the tender of Messrs. R. & J. Dempster, of Manchester, for the supply and erection of a Gadd & Mason patent spiral gasholder for 4,940*l.*, be accepted. The profit on the gas undertaking for the year ended March 1893 amounted to 2,545*l.* 1*s.* 7*d.*, and on the water account 447*l.* 11*s.* 11*d.*

THE Tees Port Sanitary Authority, at their monthly meeting at Middlesbrough, accepted the tender of Messrs. Head, Wrightson & Co. for the construction of the Tees Floating Hospital for 6,000*l.*

MESSRS. WERNER, PFLEIDERER & PERKINS, Limited, write to us:—We have pleasure in informing you that in consequence of an arrangement which has been come to between the firm of A. M. Perkins & Son, Limited, and Werner & Pfeleiderer, whereby that branch of the business of the former firm, which comprises the manufacture of the well-known "Perkins's patent steam-oven" has been combined with the London branch of the latter firm, who have so successfully introduced their highly-appreciated "Universal" and other mixing-machines, and the Wiegthorst draw-plate oven, into the

English market, we are in a position to promptly meet all demands that may be made upon us for any of our widely-known specialties. At the same time we are prepared to furnish all sorts and kinds of requisites for the baking and confectionery trade, and we will undertake any work in connection therewith, from the building and fitting up of a complete bakery to the supply of the smallest article required for the same. The head offices and works are at 43 Regent Square, Gray's Inn Road, and the show-rooms at 117 Queen Victoria Street.

QUESTION OF EXTRAS.

THE Second Division of the Scottish Court of Session has just disposed of an appeal from the Aberdeen Sheriff Court in an action by Peter Bisset & Son, builders, 152 West North Street, Aberdeen, against the Aberdeen School Board, for payment of 165*l.* 8*s.* 4*d.*, the balance of an account for extra masonwork at the Rosemount School. The pursuers explained that the work was certified by Mr. James Souttar, the inspector and architect, who, under the conditions of the contract, was declared to be sole arbiter. The defence was that Mr. Souttar was only engaged by the defenders to a limited extent, and that under the general conditions of the contract the pursuers were entitled to be paid for only such extra works as were authorised by Inspector William Dinnes. After proof, Sheriff-Substitute Brown found that Mr. Souttar was not the inspector, and, as such, the arbiter. On appeal, Sheriff Guthrie Smith recalled and discerned as craved.

The Second Division has recalled the judgment of the Sheriff, and reverted to that of the Sheriff-Substitute, finding the appellants entitled to the expenses of the appeal.

Lord Young, who delivered the opinion of the Court, said that, whilst he was not sure that the judgment of the Sheriff was not the best for all parties, still he could not assent to the proposition that Mr. Souttar had been appointed inspector and that his certificate was conclusive. At the same time, his lordship suggested that parties might arrange not to litgate further, but should refer to some respectable tradesman to examine the whole work, and see whether anything, and, if so, how much was due to the pursuers. He thought that that would be a becoming course, and he rather understood from what was said by the appellants' counsel that the parties, if they had not finally arranged to take that course, had been seriously contemplating it as the most judicious way of bringing to a determination this dispute, which he regretted had arisen.

NEW BOOKS.

WE have received from the offices of the "Amateur Photographer's Annual," offices, 1 Creed Lane, E.C., a copy of the 1893 edition of the "Annual," which will be of much interest to amateur photographers, who are now so numerous in all parts of the kingdom. The "Holiday Guide" section has been much extended and brought up to date, and will be found a complete gazetteer to the United Kingdom. A list of over a thousand dark rooms is also given.

MESSRS. E. & F. N. SPON, 125 Strand, have just published a treatise by Mr. W. H. Delano entitled "Twenty Years' Practical Experience of Natural Asphalte and Mineral Bitumen." The author treats exhaustively the nomenclature of asphalte and its combinations, of its uses, modes of application, and then proceeds to give a fund of information in general observations. It is a treatise that no one who has the charge of streets should be without.

MESSRS. CROSBY LOCKWOOD & SON, of 7 Stationers' Hall Court, E.C., have just brought out a new catalogue of books relating to engineering, applied science and technology, which will be invaluable to many for purposes of reference.

SCHOOL BUILDING IN AMERICA.*

WE can quite imagine this is a work that has frequently in the past been desired by architects. The practical work of school and schoolhouse building is dealt with from first to last. Notwithstanding a very large amount of letterpress, the book is mainly devoted page after page to illustrating school buildings, accompanied by the plans and all the detail drawings, even to the smallest details. In this way the book may be said to be an architect's portfolio of designs and plans, working drawings, &c. Twenty pages are devoted to the Fowler School House at Cleveland, Ohio. Illustrations are given of the several elevations, cross sections, four plans, viz. basement, first and second floor and roof plan. Fifteen pages following contain the detail drawings. The pages are some-

* *Palliser's Common Sense School Architecture.* By Palliser, Palliser & Co., architects, New York. (B. T. Batsford, publisher, 94 High Holborn.)

what larger than the illustrations given in the architectural newspapers, so that full justice could be done to the drawings. The whole of the specifications are given for a school at Cleveland, Ohio; five pages of small type. In addition to the great number of schools thus fully dealt with there are also convents and churches and other buildings; also the design for a school house which is not to be followed. There is much information as to sanitary matters, lighting included, and as to the selection of sites, and some amusing stories about competitions are told. The following is one:—

"A firm of carpenters and builders informed us that their city was to build a fine new building to cost between 80,000 dols. and 90,000 dols., and that they would like to submit a plan, but did not have the requisite ability to draw the plans themselves, neither did any of the draughtsmen or architects in their city, which contained about six architects' offices, and as we could not compete ourselves direct—the committee being dead against any Northern architects—therefore we concluded arrangements with the firm of builders to prepare for them sketch-plans and specifications with which to enter the competition with about ten others, all local productions, or from an adjoining city. The plans prepared by us were promptly adopted by the committee, and the builders who presented the same also secured the contract to erect the building, and in the main entrance a tablet was put up giving the names of the committee, architect, &c., and the name of one of this firm of builders was engraved on the tablet as architect. Later it leaked out through a draughtsman who had been in the firm's employ, but was now working in the office of an architect in the same place, that the plans and specifications for the building in question had been prepared by Palliser, Palliser & Co., and accordingly the architects in the city, who were very bitter about the whole matter, sent a communication to us, asking us to render the profession in their locality a service by coming out openly and giving the facts, as they stated that all the architects competing were satisfied in their own minds that the carpenter who claimed to be the architect, and whose name as such was cut on the tablet, could not do such a piece of work, as he had never been known to plan anything larger than 1,500 dols. to 2,000 dols. dwellings, and then in his own genuine style of carpenterology, but since the erection of the new building referred to he had gained a prestige over all the architects in the locality, which they did not relish."

As there are in this work considerably over 100 pages, the price (four shillings and sixpence) seems ridiculously small.

AMERICAN FIRE BRIGADE MEN IN EDINBURGH.

The team of American Fire Brigade men paid a visit to Edinburgh and were entertained by the municipality. The team numbers nine men of the Kansas City Fire Brigade, and it includes and is in command of Mr. George C. Hale, chief of the brigade. The men are a picked team, and undeniably smart in appearance; all of them particularly young, rather short, like and active looking. One or two of them, in fact, have had a training as acrobats. They are accompanied by Mr. R. S. Tinsley, lately superintendent of public buildings in Kansas City. The chief of the brigade, Mr. Hale, has among his professional brethren a reputation for inventiveness, and he has brought with him for exhibition some of his special apparatus—in particular an automatic harness, which is practically instantaneous in action; and an engine called a water tower, by which a powerful jet of water can be delivered at a height of 50 or 60 feet above ground, and directed at pleasure. A couple of finely-trained horses have been brought over to work the apparatus and assist the team in their exhibitions. The visit of the team to the city naturally invites some comparison with the Edinburgh corps, and it will surprise some people to learn that while Edinburgh spends some 4,000*l.* a year on its modest brigade of thirty-eight men, Kansas City, with 65,000 fewer inhabitants, has a fire brigade of 160 men, on which it spends annually 36,000*l.* Of course the conditions in the two cities are essentially different, and there is no comparison between Edinburgh, with its solidly-constructed buildings, which are the best insurance against the spread of fire, and the jerry structures of a mushroom town like Kansas City, where the chief object is to get rich soon, without much regard to the sort of fabric in which the money is made.

TECHNICAL INSTRUCTION IN CHESHIRE.

AN interesting report has been issued by the Technical Instruction Committee of the Cheshire County Council in relation to the technical instruction that is being carried on in that county. The committee have agreed to the appointment of a deputation to visit various institutions on the Continent to see the systems adopted in regard to instruction in agriculture specially, and to make inquiries into the cost and results of such work before proceeding further with the matter of providing an agricultural school or college for Cheshire. A grant

of 1,000*l.* has been made to provide instruction on Saturdays for teachers employed in elementary schools, whilst a number of scholarships in agriculture, dressmaking, cookery and other domestic subjects have been arranged. An application for aid from a grammar-school led to an inquiry into the condition of the grammar-schools of the county. A sub-committee has been appointed to visit the various schools, and after meeting the respective bodies of governors, to report to the Technical Instruction Committee in what manner (if at all) they can be assisted. The committee have placed aside a sum of 10,000*l.* to be applied in assisting authorities in providing suitable buildings and apparatus for better carrying on the work of technical education, and also 6,000*l.* to be applied in acquiring and equipping a suitable building, &c., as an agricultural school for the county. Over 3,000*l.* has already been made in grants towards the erection of buildings for technical education, &c. Plots of land for experiments and demonstrations in agricultural processes have been secured. Before the committee commenced to make grants there were but 2,928 students in the administrative county of Chester who could, in the widest sense of the word, be said to be receiving instruction in technical subjects. That was in the years 1890-91. But for the years 1892 and 1893 the number under instruction at the various institutes and classes has been 8,598, or with teachers and attendants at special lectures a total of 9,813, whilst the number of local authorities who have adopted the Technical Instruction Act has risen from one or two to eighteen in two years.

HAYWARD'S PATENT STEEL LATHING.

WE have received from Messrs. Hayward Brothers & Eckstein samples of Hayward's patent steel lathing, plastered as well as unplastered. The illustration shows the elevation and section, which, when covered with plaster, is an efficient protection from the spread of fire. Fireproof construction is imperfect without an approved metal lathing, as wood-planked ceilings, linings and dados to walls, staircases and lift wells are considered favourable to the spread of fire. Hayward's patent steel lathing is made from sheets 6 feet by 2 feet, a convenient size for handling. The plain sheets, although light and pliable in themselves, when treated by Hayward's patent lathing machine become very stiff and rigid. The machine cuts slots, and raises ridges and corrugations in the peculiar manner seen

in the section, being the same in appearance on each side; there are no sharp edges to cut the plaster; the metal is not cut away or across the fibres, hence the full strength of the material is retained, and the sheet becomes as stiff as a half-inch plank—so rigid in fact that a piece 6 inches wide, plastered and laid flat with a clear bearing of 18 inches, carried $1\frac{1}{2}$ cwt. in the centre

girders, wooden pillars, &c., or for covering for steam pipes, boilers, flues, &c., and will not expand by heat and detach the plaster. Plastered it weighs about 5 lb. per foot super. The cost is from $1\frac{1}{4}$ d. to $1\frac{1}{2}$ d. per square foot in the two thicknesses made. Further economy may also be expected in savings from reduction in fire insurance. Fewer supports are wanted. The

easily. The manner in which the sheet is slit affords a firm hold for the plaster, and is not liable to cut off the key. It is equally efficient when fixed vertically for partitions or horizontally for ceilings, and is quickly and easily fixed by a few wire nails. It is easily cut by an ordinary pair of snips, readily adapts itself to any form for cornices, for covering iron columns,

roughing or furring coat is dispensed with, and only one-half of plastering material required. Other advantages are the saving of time, with one coat less to lay, also the time saved in drying. There is no risk of cracking. It is equally adapted for walls and ceilings, and floor space is saved by the partitions being less.

FLETCHER, RUSSELL & CO., LIMITED.

WE recently had the opportunity of visiting the well-stocked showrooms of Messrs. Fletcher, Russell & Co., Limited, 115 Cheapside, E.C. As gas engineers and artistic ironfounders, Messrs. Fletcher, Russell & Co. deservedly enjoy a great reputation. Besides their establishments at Warrington and at Manchester, they have also chief works in London, at No. 41 Tabernacle Street, E.C. At the Cheapside House, the ground floor and three floors over are entirely devoted to the display of their well-known specialties in mantels, mantel registers, lavatories, gas specialties, &c. The excellence of these has long been appreciated by London as well as by north-country architects, and they have also been considerably used abroad, many orders being at present in course of execution for Paris. The arrangement of the various suites of showrooms has been carried out in an orderly and methodical way, so as to give an exhaustive display of goods for all requirements in their own department. The topmost floor, we understood, was devoted to the purposes of the counting-house. The floor below (third floor) will occupy a visitor some considerable time if he walks round and inspects the display of goods. In addition to registers, stoves, mantels, overmantels, lavatories, and goods in connection, there is an ample display of what we may call knick-knacks, fancy articles of a kind that are indispensable, and not for ornamental purposes alone. Articles, for instance, that make up the equipment of the writing-table, bevelled glass mirrors, wall brackets, &c., mounted in ornamental metalwork. Fireplaces with overmantels and bevelled mirrors are seen, elegant and effective, though not costly as to price. Indeed, the remark applies throughout, for even in the class of work of the highest elaboration to suit the most sumptuous requirements, the prices are remarkable for their moderation. Attention may be called to one or two specialties, as space will not permit of doing justice to all. No. 125, a combination mantel and register, has a pleasing effect; it is made in different sizes, has tiled sides in

good design, patent fireproof back, and has been much patronised by architects. It is well suited for any description of room, being made in various sizes. Much might be said in praise of schemes of colour worked out on all the goods throughout the showrooms. Often very delicate tints have been employed, adding greatly to the general effect. It may be mentioned that No. 125 can be had with cast-iron sides and fittings if preferred in place of tilework. The flueless hall stoves of the old C pattern have a great reputation, and these can be had in many degrees of elaboration for ornamental effect. The Leopold mantel register, with No. 6 overmantel, is one well worth inspection, the ornament on one we examined being particularly pleasing. The Leopold is also made in various sizes—that for bedrooms is a compact little object that will find favour with every one. There is a large and varied assortment of fine lavatories, fitted up in several cases with bevelled glass mirrors, tile decorations, &c. These also are made in several sizes. Basins to suit all positions and requirements can be had. Among other articles on this floor are tables for restaurants, oblong and round, with marble or wood tops, samples of chairs for theatres, ships' chairs, &c. The second floor is devoted nearly entirely to the display of mantel registers and stoves, gas stoves, tile registers and interiors, for all purposes and kinds of buildings. The "Palatine," No. 260, should have special attention drawn to it, as most suitable for heating warehouses and schools. It is furnished with a ventilating grate, or with a non-ventilating grate, as may be desired. The grate has a large and powerful fire. The back is doublecased, fitted with gills, close jointed, and extra strongly made throughout with ventilating fender for admitting fresh air. It is made expressly for the purpose of heating large spaces. Chimney pieces, mantels or mouldings can be fixed outside of the grate (if desired), where more decoration and effect is wanted. The grate, as supplied, is self-fitting and is complete in itself.

The new mantel register, No. 140, with No. 17 overmantel, also made in various sizes, is particularly good, and the overmantel a handsome one, with central and two side bevelled mirrors. No. 111, which can be fitted with No. 1 or No. 10 overmantel, has handsome tile fittings, and is well suited for a drawing-room, or in its other sizes for sitting-rooms, bedrooms, &c. No. 109 shows the same mantel register without tiled sides. Space, however, will not permit of any further description of the variety of registers, stoves, &c., some one or other of which will suit any taste and requirement.

VOLUME XLVIII. OF THE ARCHITECT.

Handsomely bound in Cloth, Gilt Lettered. Price 12s. 6d.—Office: 175 Strand, London, W.C.

The first floor is devoted in the main to display of such goods as are suitable for drawing-rooms and rooms of the same more stylish character, the collection being of very varied and high-class character. One or two may be mentioned. No. 270 recalls to mind the old hob register, a very handsome piece of work. No. 248, the "Withington" patent grate, is another handsome piece of work, with tiled sides, portable canopy and flue box, sliding ashpan, &c. This grate is supplied as a register with tiled sides, or as an interior. It is constructed to give great heating power with a very small consumption of fuel by its heat-reverberating principle, is partially smoke-consuming, and will burn almost any kind of coal. Smoky chimneys, back-draughts and blow-downs are, by the nature of its construction, almost impossible. By the air-regulating ashpan placed under the fire, combustion can be regulated to any degree of slow or semi-slow combustion. Special facilities are given for cleaning out the flues, and sweeping of chimneys is almost dispensed with. No. 152 is shown as an example of a cheap mantel, and is made in two sizes, 36 inches by 38 inches and 38 inches by 38 inches, and in varieties of decoration and finish.

No. 155 is a very handsome mantel in various styles of decoration, with overmantel and bevelled mirrors in character, and is the latest addition to the catalogue. The sizes are 38 inches by 38 inches and 40 inches by 38 inches. No. 87, the "Victoria" mantel, is a beautiful one for drawing-rooms, &c., that are furnished in sumptuous style, and has an excellent finish in the overmantel No. 19, but No. 18 or 20 are equally well adapted for the purpose. The Victoria can also be had fitted with bronze relieved with brass and copper, interior alcove and portable dog-grate No. 280.

For gas-stoves there are shown excellent tiled back-plates, which may be had either flat or recessed. No. 135 mantel, made in three sizes, is capitally adapted for parlours, libraries, small sitting-rooms, &c. The ground floor contains, among other goods, those suited for very large requirements—one being the Grosvenor range, with coal fire and gas ovens combined, and circulating boilers. Also, an elaborate alcove canopy gas-range with tiled interior and exterior. We have already gone to such length that space will not allow us to refer further to the gas-range and fire department. In the basement, amongst the display are included samples of Messrs. Fletcher, Russell & Co.'s well-known laboratory appliances, which also have so great a reputation here and abroad. In concluding it may be of interest to mention that the company's

loose enamelled linings for ranges have a great advantage in the fact that they can be so easily taken out for cleaning purposes and replaced. Also, we hear, that during the last few weeks the company have been appointed sole makers to the London School Board for a range specially designed for use of the cookery classes.

EDINBURGH WATER SUPPLY.

A SPECIAL meeting of the Works Committee of the Edinburgh and District Water Trust has been held to consider the expediency of taking steps to obtain Parliamentary powers in the next session of Parliament for bringing in a supply of water from the Manor Valley. A supplementary report was submitted by the engineers stating that the result of the boring in the Manor Valley was that the depth at which the puddle-trench required to be put down in the Manor Valley proper was on an average 26 feet, and 90 feet in the north valley, and that this involved an addition to the estimate of 50,000*l.*, making the total cost of the first instalment of 10 million gallons per day for town supply 652,364*l.*, which is equal to 65,236*l.* per million gallons. With reference to the Talla scheme, it was reported that the average depth required for the puddle-trench of this reservoir would be 40 feet, which was 10 feet more than what was assumed in making the detailed estimate of the cost of the Talla scheme, and that this involved, so far as this reservoir was concerned, an addition of 3,500*l.*, making the cost of the first instalment of 7½ million gallons per day 587,500*l.*, which is equal to 78,333*l.* per million gallons. The engineer added:—"Having carefully considered the whole question, with the additional information obtained by the boring operations at Posso and the Talla, we beg to state that we adhere to the opinions expressed by ourselves and the advising engineers in their report to the trustees of date August, 1891. Seeing that the Manor water is the nearest source in point of distance to Edinburgh, that the water to be obtained is the best in point of quality, that Parliament some years ago did sanction the appropriation of it for the supply of Edinburgh district, and having regard to the cost of the first instalment being the least of any of the schemes, we strongly recommend the adoption of the Manor scheme." A letter was read from Councillor Auldjo Jamieson, who could not be present at the meeting, suggesting some additional information as to the effect of the measures taken to repress waste. Bailie Archibald

the convener, went over the various reports, beginning with that of the Works Committee of date March 12, 1890, as to the necessity of taking steps to obtain a new supply of water; also the remit to the consulting engineers, Messrs. Hill, Gale & Mansergh, on the same question, and their report and recommendations on the subject; also the remit to the sub-committee, consisting of the convener, Bailie Walcot and Councillor Auldjo Jamieson, and their report on the subject. Subsequently it was agreed that the engineers should supplement their report by stating the various measures adopted within the last year or two for the better prevention of waste and the results therefrom.

THE SANITARY REGISTRATION BILL.

A PUBLIC conference on this Bill was held at St. Martin's Town Hall on Wednesday, the 7th inst., Mr. Andrew Stirling, president of the Sanitary Assurance Association, in the chair. The Chairman, in opening the proceedings, invited the fullest criticism of the Bill they were met to consider. The importance of the subject demanded their most careful attention, and when it was remembered that the Bill was the first and only attempt to deal with the question of sanitary registration, the Bill was only second in importance to the principle it aimed at.

Mr. Mark H. Judge, A.R.I.B.A., proposed the following resolution:—"That in the opinion of this conference it is desirable that a law should be passed providing for the sanitary registration of buildings by the Public Health Authorities." Having seen it announced that Sir Edward Reed and Mr. Aird intended to block the Bill, he had specially invited them to attend the conference. Sir Edward Reed had replied to the effect that he had only blocked the Bill for the purpose of securing further consideration of some of the details, particulars of which should be furnished as soon as possible.

Mr. Hugh Leonard, C.E., seconded the resolution, and Sir Joseph Fayrer, K.C.S.I., M.D., F.R.S., spoke strongly in support of it, urging that in view of the probable spread of cholera to this country, so important a measure ought not to be blocked.

The resolution was passed unanimously.

Mr. R. Biddulph Martin, M.P., spoke at considerable length on the details of the Bill, which he said they were prepared to amend in Committee in certain respects; but the great principle of registration they were strong upon, and if the second reading should be blocked, so as to prevent the Bill getting into Committee this session, they might rely on his introducing the Bill again next year.

The Rev. H. R. Wakefield, M.A., chairman of the Sandgate Local Board of Health, then proposed:—"That this Conference hereby authorises the Chairman to sign the submitted petition praying Parliament to pass the Sanitary Registration Bill brought in by Mr. R. Biddulph Martin, M.P., Sir Algernon Borthwick, Bart., M.P., Dr. Chas. Cameron, M.P., Dr. R. Farquharson, M.P., and Mr. Wootton Isaacson, M.P., with such modifications as consideration in Committee may show to be desirable."

This was seconded by Mr. Timothy Holmes, F.R.C.S., and spoken to by Dr. Bernard O'Connor, Mr. H. Rutherford, barrister-at-law; Mr. J. Marr, Mr. W. H. Branch and others, and carried unanimously.

OFFICE BUILDING IN AMERICA.

A TREATISE on "Modern Office Buildings" has been written by Mr. George Hill, consulting engineer, New York. At the outset he lays down the elements of a successful building, and then proceeds to consider each of his heads in detail. Among these much space is devoted to elevators as a principal feature in regard of ease of access. Plans of various styles of office buildings are given, also a great many tables relating to brick and steel skeleton construction in reference to the different number of storeys, the amount of area, costs and rents. We cannot refer more at length to the subject further than to give a short extract from two or three of the heads.

Mr. Hill begins by saying this term, "Modern office building," is used to describe the mammoth structure of many storeys that the conditions of our present business life require us to erect in all centres of population where the fever of money-getting is permitted to have full swing, unhampered by any traditions that involve avoidable loss of time.

Whether this building is so high by reason of the desire of men of all callings to come as close to a given centre as possible, to the desire of men of similar callings to be as close together as possible, is due to the superior service that can be rendered for the same outlay, or is due to the necessity to procure enough rentable space to be able to pay interest on the total amount of money invested, might be discussed at considerable length, but is foreign to the present subject except in so far as it furnishes one of the limitations of the problem.

The elements that must be combined in the successful building are:—

- (a) Ease of access.
- (b) Good light.

Electric Lighting and Power.

THE WEYMERSCH BATTERY.

Glasgow, 112 Saint Vincent St.; Belfast, Central Hotel Buildings.

- (c) Good service.
- (d) Pleasing environment and approaches.
- (e) The maximum of rentable area consistent with true economy.

- (f) Ease of rearrangement to suit tenants.
- (g) Minimum of cost consistent with true economy.

These may also be separated into two classes—those that particularly interest the tenant, which are the first four, and those that interest both tenant and landlord or the landlord alone, which comprise the balance. At first sight it might seem as though the two interests were antagonistic, but a little thought will show that if the landlord sacrifices the tenant's interest he will in some ratio affect his own by reducing the value of the space he has to rent; on the other hand, he may sacrifice his own interests in a way that will render it difficult to secure it proper return, by unnecessarily wide halls, for example, and it is to establish a proper relation between these various elements that the following is offered.

(a) *Ease of Access.*—This can be had either with a low or a high building, of which the latter only interests us. With the floors placed one above the other it is necessary that they be reached by elevators, and the solution of the problem depends on them almost entirely.

(b) *Good Light.*—This is of the utmost importance, and as is usual in such cases there is a radical disagreement at the very start as to the requirements. Some hold that only a north light is truly good, while others aver that no building is well planned that is not so arranged that there is a little sun in each office during part of the day, except perhaps in the lower storeys. Now the writer is one of the latter, and, if it were essential that the point should be settled would be ready to discuss it to any length and could perhaps convince a goodly number of those who were inclined to think so in the first place, but certainly would not convince many others.

Fortunately for our present purpose it is not of the slightest importance which way the light comes from since while we shall speak of its coming into the rooms, and thus make a certain arrangement preferable, if the plan were reversed it would still be desirable to keep the axis in the same direction so as to get more of the north light.

The first point then is to get the proper direction for the axes of both the building and the courts. In New York we generally have this already determined by the subdivision of the city into rectangular lots with the long lines making an angle of about $21\frac{1}{2}$ degrees east of the meridian, but elsewhere

and especially where it is possible to make a selection, it should be on a bearing of north $22\frac{1}{2}$ degrees east, which agrees quite closely with the New York layout.

The axial line that divides the hours of sunlight equally is the line that should be used for the axes of the building and of the courts. It will further be evident that if the courts be made square or nearly so they will be so proportioned as to throw the shadow of the south wall on the north wall at the highest point that it can reach, and only the top of the court will ever get direct light, while if the court be made rectangular and with the long axis north and south, the light at noonday will penetrate to the very bottom during at least a part of the year, and will go the maximum distance at all times. If the court is open to the south every office that gives on it will get a glimpse of the sun every day that it is visible at all. The courts should be generally from 6 to 25 feet wide, depending on the width of the lot and the size of the offices.

From this it would follow that the ideal location would be either on the north-east or the south-west corner of the street, according to preference for either north or south light.

The light must be let into the offices through windows, no matter where it comes from, and these must be made ample. Requirement (f) makes it desirable to use a unit for an office of about 9 by 15 feet, and to properly light this unit requires a window at least 4 feet wide and 6 feet high, with the top not more than one foot below the ceiling. The particular point to watch is that where there are large arched openings the offices that come partly behind them shall have plenty of light, either by openings at the sides or by piercing the spandrel walls, or in some other way, as the volume of light from the top of the window is of much greater lighting value than that coming in at the floor. Under no circumstances should that part of a window that is below a point 20 inches above the floor count as a useful part of the opening. This is a particularly hard condition to satisfy, it is admitted, but it is one that is unavoidable and must therefore be met in some way.

The light in a room is also made much more effective if there is a certain amount of clear wall space on each side of the window, broken in fact only by the furniture. The ceiling should be hard finished, as this reflects much light down to the desks. For the same reason the aim should be to have all of the rooms rectangular and without breaks, alcoves or other similar construction, as they all take from the light and interfere with the tenant's use of the office in this way.

(c) *Good Service.*—Heating and ventilation should go

WALL INLET VENTILATOR

WITH INDICATORS

(DARRAH'S PATENT).

Incorrect Indication Impossible. Only One Action.

In the above we have introduced a most important improvement. It consists of an Enamelled Indicator, showing from any position when the Ventilator is open or shut. By this means all uncertainty is removed, and any person can see at a glance whether the ventilator is acting or not. The ordinary ventilator is often rendered quite useless by being shut off when it is supposed to be open, the only means of ascertaining the fact for a certainty being by holding the hand over the inlet, which is often difficult of access.

We shall be pleased to send a Model of Full-sized Ventilator on approval, carriage paid to any Architect for inspection.

together, and form a serious problem, since cost and methods of construction will not permit of a complete indirect heating plant, and it is also probably the case that it would not be satisfactory to the tenants, while the cost of operation would be very great. Fireplaces are not permissible, since they will in almost every case prove to be an unmitigated nuisance, always coming in the wrong place, taking valuable room just where it is most needed, and forming a serious item of cost when properly treated. They serve, however, to take some of the foul air from the offices, and so do a little good to justify their existence. Probably the removal of the foul air can be sufficiently well accomplished by putting in transoms over the hall doors and opening the halls to the outer air at some convenient point where there will be no back draught into the halls. If it is preferred, moderate-size ventilating pipes could be run to each of the offices, being collected into a main stack running vertically through the building, and the circulation assisted by means of a small fan run occasionally simply to start the circulation. Exhaust fans have a way of taking their air along the lines of least resistance, and that makes it undesirable to depend on them entirely.

To introduce the needed air, and to warm it to the proper temperature, it is desirable to use a direct radiator, with a box base, connected with the outer air by means of a small galvanised iron pipe with a damper in it, so arranged as to open the base to the air in the room as it closes it to the outer air. Then in the morning, when it is desired to warm up quickly, the damper would be closed to the outer air, and the air in the room would be warmed by the circulation which this radiator would set up. As soon as the air was of the proper temperature, it would be maintained at this point by the opening of the damper so as to admit the fresh outer air, warming it as it enters. Such an arrangement is no novelty, and has been found to be generally satisfactory.

The Plan.—There must be on each floor the elevator-well, the halls, the stairs and the toilets. Each of these require a certain amount of space, and for economy of construction it is desirable that the various floors be made duplicates as far as possible, while for some of the features it is a necessity.

The halls depend on the size of the building to a certain extent, but for the usual case of the 25 by 100 or 50 by 100 feet building they must be made as small as possible. Then we would make the hall on the ground-floor as direct as possible from the street to the elevators, and 8 feet wide, with a space in front of the elevators of the size of the well. For the upper

floors, if the space be made 4 feet wide in front of the cars and the halls 3 feet 10 inches wide, it will be ample if the trim is not too projecting, the space in front of the cars being joined to the side halls either by a sweep or straight.

For the stairs it should be kept in mind that they are for use only occasionally, and are in no sense ornamental features that are indispensable, except occasionally when they are meant to lead up to grand offices on the first floor above the street. Generally the money that they cost could be spent to better advantage in the enrichment of the entrance-hall. Leaving the question open as far as the special cases go, it may be said that if through the balance of the building they are made 2 feet 6 inches wide, that will be sufficient for all practical purposes. They should be placed at the end of the hall or at some other out of the way place, and be made as plain as possible.

The size of the offices must be so arranged that the man who wants a single office will get just sufficient, while the man who wants more gets all that there can be given on a floor except a minimum space reserved in the least desirable location for the toilets and stairs. This subdivision forces one into a column treatment of the façade, so as to get sufficient light for all of the offices, and also indicates a spacing of the columns in the framing that is the most economical as a general rule.

Such an arrangement gives opportunity to make the masonry piers of sufficient width to satisfy the sense of proportion regardless of their height, and introduces no greater difficulties into the solution of the problem than were there before, nor will the design of different office buildings possess any greater similarity if so laid out than they do now.

The Method of Construction.—To put it in the form that it presents itself to us would be to say, steel skeleton *versus* masonry. The elements that must decide, if we are to decide intelligently, are numerous, and each must be given its proper weight.

We can build either all skeleton or all masonry. We can also, if we please, build a masonry wall carrying only itself, and then place columns behind it to carry the loads; but this does not seem to be the best construction, since it wastes money, wastes space, and will surely lead to some very ugly cracks that never can be closed. It may possess some advantages, but they are not easily apparent. The better way would be to do all of either one thing or the other. Taking, then, for consideration the alternative, all masonry or all skeleton construction, we must consider that the masonry, if the walls are built of the thicknesses required by the New York laws, will

take up more space than the steel walls, the amount being given in one of the tables for all walls from one to twenty storeys in height. Then, if the building is placed on a very narrow lot we must have some bracing, and the masonry walls do not readily lend themselves to this. No doubt it could be done, but it is probable that it would be far from a satisfactory piece of work, and would probably lead to serious trouble in the future.

If the front and rear walls are not too much pierced, it might be safe to build with such bracing as could be had in masonry, but it would not be positively so.

The following are Mr. Hill's recommendations as to materials:—

The frame should be of mild steel, columns, girders, beams, &c., using the usual commercial shapes. The various parts should be rivetted together and the column connections so made as to maintain the full strength of the column.

The walls should be made with buff brick and terra-cotta fronts and common brick backing for the façades, with the storeys forming the basement of stone if desired, although this requires a judicious selection of the stone. The rear walls should be made with common brick and the courts either lined with enamel brick and with the beds and builds made flat, which would be the case wherever the courts are internal ones, or else painted three coats of paint finishing with one coat of enamel paint. The facing brick, where of a different size from the backing, should have every brick anchored with a Morse wall-tie as often as the courses fall even. The inner faces of the walls that are exposed to the weather should be furred, using the usual 2-inch furring blocks, the usual hollow bricks of Haverstraw size having proved to be a delusion so far as excluding moisture goes.

The fireproofing may be either of the hollow flat arches familiar to all or of the new Manhattan type, either having proved to be good. The blocks, if used, should be so used as to fill up nearly the entire space between the flanges of the beams so as to require the minimum of filling, and the pipes and wires run in shallow channels run in the under-flooring. The columns should be fireproofed either by the use of slabs of fireclay, each slab securely wired to the others in the course, or else the column should be outlined with small L's and wire lath stretched over and plastered thoroughly, the writer's preference being for the wire lath and plaster. Every portion of the frame should be so treated, including the columns that are so laid out as to aid in the wind-bracing, and especially covering

all columns that are enclosed in stone. If the framing is carefully laid out the beams will so come that it will be practicable to show them, using either high skewbacks or the Manhattan arches without the hung ceiling below, thus effecting a small economy in cost.

The flooring in the halls should be either a marble mosaic or else a granolithic laid with a marble border, there being a small difference in favour of the granolithic. The toilets should be similarly treated. In the offices the flooring should be of Georgia yellow pine left untreated, but of course mull-dressed and carefully laid.

The plastering should be a rock plaster, hard finish, with the plaster carried into all jambs and reveals, with the corners rounded off and a small cove at the ceiling, say of 6-inch radius. The partitions should be made of a rock plaster put on corrugated iron lathing supported at intervals of about 3 feet by means of small channels or l's secured to the floor arches above and below. These partitions are but 2 inches thick, can be easily removed, and should be somewhat cheaper than the ordinary 4-inch blocks.

The trim should be of white oak, filled, hard oiled and rubbed to an eggshell finish, the base being made about 1½ by 8 inches and the architraves about 4 inches wide over all, with a backing and back mould carried down to the floor, affording something for the base to stop against and mitreing around all openings. The window trim would be similar in character, with the inner moulding carried around across the top of the base and under the stool cap, so as to form a small panel under the sill. Chair rails and picture mouldings are matters of choice, and the former is seldom of any great use.

The halls should have either a Keene's cement or Mycenian marble wainscot with marble base and cement cap, or the rock plaster can be run for a cap and a marble base put in, and then the space between painted with an enamel paint.

The toilets should have the water-closet partitions made of oak carried about 10 inches above the floor on brass legs; the urinal stall should be made of marble and the urinals either the long-lipped urinal with the "Parsons" flushing tanks for each stack, or else Mott's "Shanks" patent with individual tank. The water-closets should be either a wash-out closet or else a pedestal hopper with the seat simply a wooden rim carried on brass brackets and a copper-lined wood cistern. The wash-basins should be oval with the patent overflow and half S traps close under the fixture, with the supply pipes placed close under the slab and with shut-off cocks for each one.

FIREPROOF CONSTRUCTION.*

AT the monthly meeting of the Chicago Chapter of the American Institute of Architects a paper was read by Mr. R. Guastavino upon the development of tile fireproof construction.

After referring to a large experience in construction since his course of study in the School of Architecture in 1864, and the well-known constructive knowledge of Chicago architects, Mr. Guastavino, alluding to the tile arches, or the timbrel arches as they are more properly called in Spain, in consequence of the lightness and small thickness, and in order to fix principles, started by saying that this system belongs to the cohesive construction.

Divided in two classes, the first we shall call "Mechanical Construction," or by gravity. The second we shall call "Cohesive Construction," or by assimilation.

The first is found in the resistance of any solid to the action of gravity, when opposed by any other solid. From these conjunctive forces, more or less opposed to one another, results the equilibrium of the total mass, without taking into consideration the cohesive power of the material set between the solids.

The second has for base the property of cohesiveness and assimilation of several materials, which by a transformation more or less rapid resembles nature's work in making conglomerates.

We can give another definition more precise and comprehensive for both systems, in saying that the first or mechanical system is that all the pieces can be separated one by one and then rebuilt in the same or similar manner. To this class belong the pyramids of Egypt and the Greek temples, &c. In "cohesive construction," on the contrary, the components cannot be separated without destroying the integral mass. To these belong the Babylonian walls of brick with hydraulic mortar; the vaults and cupolas of the Assyrian, Persian, Arabian, Roman and Byzantine, the antique and Middle Age conglomerate construction.

The structures built by the "gravity system" can be at any time taken down, in the pieces out of which they were formed. Thus the stone or brick that yesterday formed part of a temple or monument dedicated to the memory of a hero can to-morrow belong to or form part of the walls of a stable; while, on the other hand, though man cannot again use the parts of cohesive construction for modern buildings, their ruins inspire respect

* From the *Inland Architect*.

and veneration, and only nature with its slow but sure work of disintegration can take from this style of building its materials for her immense laboratory.

The materials employed in the construction by gravity only require the physical quality of hardness; for the "cohesive construction" the materials must not only have proper physical conditions, but it is absolutely necessary to take into consideration the chemical properties of the substance employed. The use of the "cohesive system" was rendered impossible to many nations that had neither the material nor the knowledge of its use at their disposal, while on the other hand all the civilisations and all nations could make use of the gravity system.

The base of these materials are mortars that do not require exposure to the air for their transformation or setting qualities, that is, hydraulic limes and cements, but for our specialty we must have cements of the quality of Portlands.

The way in which this kind of arch works is as follows:—A "timbrel vault" of a single thickness of brick or tile has no more resistance than an arch or vault built in the "gravity system," because no matter how good the mortar may be there is only one vertical joint, and the bricks or tiles are working as voussoirs, consequently this form of arch belongs to the "gravity system;" but if we put another course over the first, breaking joints and laid with hydraulic material, we will have the action of the cohesive force; in this way the mortar laid over the first course, or extrados, takes bond with it, and also with the course laid on top. As soon as the cement sets we will have shearing resistance represented by 17,820 pounds per square foot. In this manner we introduce a new additional strength to the arch, which is a peculiarity of the "timbrel arch system." In the "gravity system," the strength of gravity alone is the only force keeping the voussoirs in place by pressure against each other in the joints. These joints are not protected, and any reduction in the width of the joints, in consequence of pressure, or weight on the arch, compromises the setting of the mortar. For this reason in the "gravity system" the mortar serves only as a cushion, also, if cement mortar, because of bad setting, and adds no strength to the arch. But in our "cohesive system," with horizontal broken joints, with 17,820 lbs. per square foot shearing strength, the reduction in the vertical joints is protected absolutely, as can be proved by the following facts:—First, we can build barrel arches of 20 feet span, and dome of 60, 70, or more, only 3 inches thick, using a centre of 1 inch thick, and moving it along as soon as a row of tiles are laid, which usually requires

KALLKOLITH.

NEW PATENT PRIMING AND STAIN.

Acknowledged by experts of nearly every country to be one of the most important inventions of the Nineteenth Century.

KALLKOLITH is one of the most marvellous inventions of the present age, and is used as a priming in place of the now almost obsolete oil-colour. It produces an exquisite smoothness, combined with great durability, and amalgamates thoroughly with wood, iron, cement, stone, plastering, &c.

CHEAPNESS.—It saves at least 100 per cent. in comparison with any other priming now in use, being less than half the weight.

ECONOMY is manifested by the fact that one 14-lb. tin of **KALLKOLITH** goes further than three times the same quantity of oil-colour.

DRYING POWERS.—It dries within one to two hours, thereby greatly facilitating the quick dispatch of labour.

DURABILITY.—Where **KALLKOLITH** is used it imparts an amount of durability to all oil-colours used upon it which has never yet been obtained, and one of the most important advantages in its use is that the paint put upon it does not blister.

PAPER-HANGING.—Walls prepared with **KALLKOLITH**, thinned with seven parts of water, give a great additional advantage to the hanging of all descriptions of papers.

Price per case of 8 Tins of 14 lbs. each, net 40s., packing included. Special Terms to Wholesale Buyers and Shippers.

Address—E. STUTTARD, 88 ADELAIDE ROAD, BROCKLEY, LONDON, S.E.

about fifteen minutes; second, it is common to see the working men walking over the arch, free from centres of any kind, some hours after it is built; and third, we can run the centre under the arch again when it is completed, which is the most practical illustration that the arch has had the absolute repose necessary for its settlement.

These three remarkable circumstances are of great value to architects, as they can be put in the specifications and can be depended upon as absolute proof of the safety of the construction.

So we have for the "cohesive construction" the following advantages over the brick arch or any arch built by mechanical construction:—

First—The protection of the vertical joints by introducing the new strength coming from the horizontal breaking joints.

Second—The less number of vertical joints, amounting to only five per cent. of the full span, while the brick arch has ten per cent.

Third—The resistance to deflection (bending movement).

The result of these advantages is the surprising strength of the "timber arches," so that no one can at first understand how fifteen or twenty-foot beams, arches and domes of seventy and more foot span, three inches thick and ten per cent. rise, as we before said, can be laid, taking away the centres and giving them over to the uses of the building in a few hours, when an arch of brick, six-foot span, four inches thick and ten per cent. rise, requires for constructing it strong and heavy centres, with repose for several days, and then is not a safe construction, as this span requires eight inches of thickness, as all architects and builders know.

We can consider as a safe relation between the brick and "timber arches" four feet six inches span, ten per cent. rise, four inches thick, with cement mortar as is usual in buildings, as equivalent to a ten or twelve-foot span "timber arch" three inches thick, eight to ten per cent. rise.

The impossibility of having a flat arch built with voussoirs, principle strictly tight, in consequence of the imperfections and impossibilities of having a tight and well-set joint, because this joint is only worked as a cushion, is one of the main objections that the Catalonia and Valencian architects have against the use of flat hollow block arch for fireproofing buildings. The slightest settlement in the centre, so common in these kind of arches, opens the joints, and in case of fire you will see at once the smoke passing through and in consequence showing that air and gases pass from one habitation to the other; and

although the cheapness of iron and the facilities that we have for manufacturing any kind of claywork gave a great impulse about twenty-five years ago to the system now in use—that is, hollow block iron beams, and so on—the said inconveniences soon became noticed, and it was found to be unfitted for our conception of fireproof buildings; but in places where we had never considered that system and never used it under any circumstances, as in cellars, ceilings, and very few in the first floors, because the places where it is most necessary to have a homogeneous, tight and solid material as a general base for the building are the ceilings of cellars, because that is where the emanations, moistures, fires and complications of pipes, wires and conduits make it more necessary to have a perfect masonry construction.

But I do not say that the tile system is the only one adjustable for everything. The flat block ceiling has its advantages. Progress and new necessities and the manner in which we consider buildings to-day has somewhat changed their character, and many of them are not well adapted for full masonry construction. For instance, an office building cannot be so well adapted as a church, or hall, or library, and other public buildings of that character, but in each case the principle can be adapted with modifications always beneficial. With the tile method of construction the desirable forms are as follows:—1. Walls: the most desirable ones should be hollow. I do not mean walls built with hollow materials, but walls built hollow, or tubular columns of clay, cement or stone combined with iron.

2. In ceilings it is preferable to use domes instead of barrels with solid or cohesive materials. The barrel arches are an exceptional construction and good under some circumstances, but they are not the best for cohesive construction, the right one being as already stated, domes, and the spans should be 12 by 15 feet or 14 by 17 feet.

3. As a principle for the conception of any building inside of the system the following conditions must be taken into consideration as guides:—(1) Floors must be perfectly tight between, so as to have an absolute intercommunication, and to be as near as possible airtight. (2) No wooden flooring, wooden wainscoting or wooden casings should be used. (3) Doors, windows and any openings should be prepared in such a manner that any fire in one or more rooms could be isolated by stopping the alimentation of combustion, that is, combating the fire by direct asphyxia or want of air, which is a very easy matter if well prepared for; but for this purpose

Chief Office and Works:—Vauxhall Walk and Glasshouse Street, London, S.E.

buildings must be divided into three different groups, which would require three different treatments.

First Group.—Private houses, office buildings, hotels and public buildings.

Second Group.—Department stores, factories.

Third Group.—Storage buildings.

For the first, tile construction has the advantage that each room can have its special dome supported by double tile partitions and main walls all around. The partitions should be placed as much as possible one above the other, which practice is one of the recommendations of good Classic construction. The same should be the case in office buildings. Each room could have a dome supported by double partitions. The same also in hotels.

For the second and third groups the precautions that should be taken are the same as in the first group, but in addition all windows and doors must be provided with double doors or shutters, one of them of sheet-iron, so that all joints can be re-joined from outside in case of necessity.

I will remark, by the way, that to develop this system a Spanish architect, and especially a Catalanian, one in his own country, has an advantage. First, there the architect who is inclined to the constructive parts of his profession has an opportunity at any time to be not only the architect of a building, but also the contractor of the same, so he is able to do as he pleases in regard to construction, and he feels safer. Of course everybody knows that the architect is directly responsible before the owner, the public and the authorities, so it is hardly strange that practical and intelligent owners in Catalonia do not object to this, but, on the contrary, they prefer to give to the architect the contract, asking him to give bonds and guarantees. It is also easier, because by law the architect is directly responsible for any trouble on a building. The building department also compels the owner to have a responsible architect on the building, and if the architect is the contractor the ordinances leave him free to do as he pleases in regard to construction, restricting only the hygienic part and urban lines.

THE Baths Committee of the Liverpool Corporation have resolved to recommend the Finance Committee to offer a premium for the design of the new baths which it is proposed to erect at the St. George's Pierhead, the construction of which would not cost more than 20,000*l.*

SEWAGE PURIFICATION, HUDDERSFIELD.

THE new sewage disposal and purification works, constructed by the Huddersfield Corporation at a cost (including intercepting sewers, destructors, sludge presses, electric light plant, &c.) of about 69,000*l.*, have been opened. The Corporation acquired about 44 acres of land at Deighton for the scheme, but the works and buildings only cover an area of 8½ acres, and the remaining space has been laid out as a small park. Mr. R. S. Dugdale, C.E., the borough engineer, designed the scheme, as also the intercepting sewer conveying the sewage to the works, which are capable of dealing with 7 million gallons of sewage per day (or the sewage from a population of 250,000 based upon a flow of 31 gallons per head); but the present dry weather daily flow is about 5 million gallons. There are 24 precipitation tanks, each to hold 47,500 gallons, and the same number of small polarite filter-beds. The process of purification may briefly be described as follows:—The crude sewage is received in the "roughing" tank; it then passes the screening chamber and is mixed with ferozone, a chemical of no fixed composition, but varied to suit the sewage under treatment. It then passes into the purification tanks, where the solid matter, coagulated by the action of the ferozone, quickly subsides as sludge, and the clarified sewage is then admitted on to the polarite filters, from which it emerges in a bright, clear, colourless condition and free from objectionable smell.

The degree of purity is very high, showing as much as 88 per cent. reduction of albuminoid ammonia. The effect of this simple and rapid process created much surprise and interest. To demonstrate how efficacious the treatment was, several gentlemen tasted the bright and colourless water. The Corporation authorities had, it should be stated, tried the system experimentally nearly two years ago, and had placed gold and silver fish in the effluent, which are still to be seen. Some were taken out and again placed in the effluent now issuing from the polarite filters. The sludge is pressed and reduced to clinker in the destructor. The pressing machinery was supplied by Messrs. Goddard, Massey & Warner, of Nottingham. The system of purification adopted is the well-known polarite and ferozone one of the International Water and Sewage Purification Company. Messrs. Radcliffe & Co., of Huddersfield, were the contractors, and Mr. Clayton the resident and assistant engineer under whose superintendence the whole of the work has been carried out.

GLOBE WORKS, LINCOLN.

HOLBORN AND STRAND IMPROVEMENT SCHEME.

MR. W. ROBINSON has just published in concise and consecutive form his recommendations of how this important work should be carried out. He also illustrates his short essay with various plans. The following extract will, however, be sufficient to explain Mr. Robinson's views:—

The simplest, least costly and in all ways the best way to get from Holborn to the Strand, and bring the fine square of Lincoln's Inn Fields and its stately trees as a picture into central London, is that shown in the plan. The effect would be good in all ways, as the square and many important buildings near, including the Law Courts, would come into the prospect. The fine open situation should certainly lead in the near future to buildings of the highest class being erected. The poor effects of Charing Cross Road and Shaftesbury Avenue point to the advantage of a street with a certainty of fine effects. The alternative line is truer and simpler, as will be seen by the plan, the same ends being attained as in that of the County Council plan, but by simpler means and far less costly.

Moreover, an improvement almost as much needed as the street from Holborn to the Strand would be effected at the same time, that is, the making visible of Lincoln's Inn Fields itself. This great square, which, with its surroundings, might give the finest effects possible in central London, is now almost inaccessible. In Paris or Vienna such an opportunity for improvement would be seized at once. I do not remember any square in either of these cities with such advantages; yet its rat-hole approaches from Holborn are so narrow that one can reach from wall to wall in passing.

The only "objection" I have heard mentioned to this way through the Fields is the puerile one that it would interfere with the quiet of the square, as if a vital improvement of the highest value to the square and neighbourhood should be barred for such a reason. A claim to exemption from traffic, denied to the houses in Pall Mall, Piccadilly, the Rue de Rivoli, and all the finest streets of the world, is not in any way reasonable. Moreover, only the west side of the square would be passed by.

The greatest gain of all is the question of cost. The property necessary to remove to open the line is far less in area and far less in value—probably nearly one-half; while the value of the reimbursement through the rebuilding around would be greater than in the proposed less interesting line of the County

Council. The perfectly simple line of the Lincoln's Inn Fields street would, by widening the Strand up to Catherine Street, do the work of the lower spur street of the Council plan and the work of the great street as well.

Views of the Law Courts and other important buildings near could easily be got without sacrificing the more valuable frontages. A most important gain is getting rid of the ugly protuberance in Holborn; the large angular space would form a useful space in Holborn, and be a much needed aid to traffic at the junction of the new street and Holborn.

The question of time is also worth considering, as in the eastern line the ground is clear, not only in the important section of the Fields, but near the Strand, where large spaces have lately been cleared. Between the Square and Holborn there are but very few buildings, so that a valuable gain of time would result, and the public might very soon get relief in this—a want for many years past.

The Council should waste no more time in trying to find some more equitable mode of taxation than now exists, but get to work on this very urgent improvement at once, which it is clear can be carried out at a less cost by a better line of street, and so remedy promptly and effectively what has been for many years a great inconvenience to the public.

As to cost, I put that question before Mr. Spencer Chadwick, of Parliament Street, who well knows the value of property in the district, and he replied "At least one-third less than in the proposed line of the County Council." He has surveyed the ground for me and set out this plan, and wholly agrees with me that the eastern line is by far the best line.

Apart from beauty of line, simplicity and economy, there are other advantages in the Lincoln's Inn Fields line which are important, the first being in avoiding displacement. It will be clear to any one who looks at the County Council's plan that it can only be carried into effect with immense loss in displacement of occupiers of whom Parliament compels the rehousing, and this much complicates the scheme.

Most of the ground in the Lincoln's Inn Fields plan being clear, the displacement difficulty is got over. Another point of advantage is in the relation between the Lincoln's Inn line and the larger streets and roads going north. It could not be better; also the southern connection with the river and Strand streets, and any bridge that may be required there in future, is also simple and direct.

It will be clear to any one who carefully examines the site that in it we have an opportunity of opening up views and

effects worthy of the best parts of London, Paris or Vienna. But the approaches to the Fields are so ridiculous that people are not led to think of the noble chance that is wasted there; the narrow streets and passages which have to be faced to get to the Law Courts are suggestive of anything but the beauty of the site. Yet from the upper storeys of the houses on the west side of Lincoln's Inn Fields there is not merely a good view, but a picture the like of which neither Florence nor Paris could show.

It is surely our first duty to bring as much of this beauty as we may into the common possession, especially when we may do it so easily and promptly, and at the same time and by the same means add so much to the public convenience and to the health and airiness of the neighbourhood.

READING WATERWORKS EXTENSIONS.

THE Corporation and others lately visited the recently extended waterworks at Fobney. In the new engine-house two triple expansion Worthington pumping-engines have been erected in addition to the turbines hitherto in use. The Corporation inspected the intakes from the river Kennett, the polarite purifying chambers, and finally Mr. Walker's patent sand-washing appliances. With the new engines and polarite filters a water supply of over four million gallons a day can be guaranteed to the town. The polarite chambers are eight in number, each having an average thickness of $3\frac{1}{2}$ feet of material; four of these polarite beds or chambers were started in December 1892.

The water from the river intakes passes through a chamber filled with coke, to keep back leaves, grasses and other floating substances; it then flows vertically through chambers filled with polarite, a production of the International Company of Westminster—a material selected for filtration purposes, after an exhaustive inquiry into the various systems of filtration at home and abroad, on account of its simplicity of application and its efficiency as a natural filtrant; it removes all discolouration and contamination of the water by organic matter. The water came from the polarite chambers beautifully clear, and Reading claims to be the first town to adopt the system of working the water through polarite without a fall—a feature of great importance at works such as those at Reading, where the position does not admit of any fall, because the authorities desire to use their existing sand filters after the water has been oxidised in the polarite chambers.

The International Company, the sole makers of polarite,

however, recommend that where practicable the river water should first be strained or clarified by percolation, and then passed through polarite to oxidise any organic impurities and colouring matter in solution.

One of the most useful additions to the new works is the patent sand-washing apparatus, the invention of the waterworks engineer; it consists of a battery of cone-like receivers, each connected by a flexible pipe with a small Worthington pump. By the use of these cone washers an enormous saving in water and labour is effected.

SPONTANEOUS COMBUSTION OF COAL.

At the meeting of the South Staffordshire and East Worcestershire Institute of Mining Engineers, held at the Mason College, Birmingham, under the presidency of Mr. W. B. Scott, chief inspector of mines, Mr. H. W. Hughes read a paper on "The Spontaneous Combustion of Coal," which, he said, was generally attributed to decomposition of iron pyrites, to pressure and to the oxidation of the organic constituents. He said that he had come to the conclusion that iron pyrites played a very unimportant part in the spontaneous combustion of coal, so far as direct action was concerned, but that it might materially assist by disintegrating the coal and by producing a slight rise in temperature. When it existed in the form of bright brassy lumps and veins little danger was to be apprehended, but the maximum effect was exerted when it occurred in the form of a dark amorphous powder finely disseminated through the coal. He also argued that coal never fired in the solid, and said that if combustion commenced in a large pillar, that pillar would be found to be fissured. Pressure on pillars greatly increased the danger of spontaneous combustion, but it was doubtful whether such action alone would start a fire. He then endeavoured to show that oxidation of the organic constituents of the coal was the main cause of underground fires, and stated that the coals most liable to spontaneous combustion were the highly-oxygenised semi-bituminous varieties, containing a large proportion of moisture. Discussing the prevention of such fires, he gave it as his opinion that the only method was to circulate as large a current of air as possible through the workings, to carefully remove all fine coal from the mine, to exclude as completely as possible all air from the gob and from heaps of shale, &c. in pillar workings, and in long wall workings to stow the gob carefully and completely, keeping the pack walls continuous.

CHICAGO BUILDINGS.

IN a letter to the *Daily News* the special correspondent asks, How far does Chicago answer to the claim that it is a phenomenal city—a metropolis more representative of the United States than either New York or Boston? Where the tall writing must, he says, be discounted is where it must needs make Chicago beautiful. Some day it may be so, but at present it should stop at its rapid progress and colossal prosperity. There are many fine edifices architecturally, no doubt, but for the most part the blocks of the skyscraper order, whose wonders are proclaimed with pride, would not satisfy an æsthete. Some of these buildings of anything between thirteen and twenty storeys are too like a cotton factory, and others which have had money lavished upon exterior ornament have it so high in air that your neck is in danger when you try to study it. The straight lines of streets due north and south or east and west are on a simple and practical plan, but they offer too much uniformity of buildings. A skyscraper may be a triumph of architecture in its façade, but if it rears its head a hundred feet above its neighbours, and presents end views of plain brick, naked and not ashamed, it becomes an eyesore. There are many such, and a few also like the Auditorium block, palatial in its finished harmony. Though you may get satiated with these monster buildings, you cannot forget them. They dominate everything. Of the many things in Chicago which are “the finest in the world” is the Masonic Temple, an affair of twenty storeys, total height 260 feet. Like the Women’s Temple, it is mainly let out in shops and offices, and there are 500 such, paying rents that produce a total of wealth that ought to satisfy even an American millionaire. The details of the architecture, like the general design, are of the highest type. The red granite, grey brick and terra-cotta employed in the building combine prettily, but of what avail are those Roman arches up at the tenth storey, or the recessed bays just below? The mysteries of masonry are practised on these floors, and the general court of the building below is walled with coloured marbles, while marbles, onyx and old oak woodwork are freely used on each storey. The entire interior is heated (overheated, alas!) with steam, and fourteen elevators and two goods lifts are always at work. There is another building with 600 offices, all let to tenants at high rents, and there are dozens of others in Chicago not much behind them in magnitude and appointments. Some day when there are whole streets of such mammoth buildings, Chicago

will be one of the wonders of the world to an even greater extent than it now is. There are dry goods and miscellaneous stores, also “the largest in the world.” We have some pretty big business houses in London, but these successive storeys of square lofty bazaars outdo them in size as much as the World’s Fair outdoes the best exhibition ever held. The public buildings are almost without exception worthy of a city that is fairly entitled to metropolitan rank. Away from the heart of the business world you begin to find the dwelling-houses of the inhabitants—such of them at least who do not live at hotels and boarding-houses. In the outlying suburbs, where the working-classes live, they may dwindle, after some three miles, into mere shanties of weather-board, interspersed with shops that are not better than booths. In other directions—north and west—you have the domestic architecture of the rich, and very good, if mixed, it is. Here, again, are adaptations of all known styles, equal to original designs. Turrets, towers, gables, dormer windows, balconies and verandahs meet the eye everywhere, and fine effects in rough granite are frequent. The stone of the country is better than its wine, and each state seems to have its specialty in material for the builder.

IS A HOARDING A BUILDING?

A CASE came before Mr. Justice Kekewich in the Chancery Division of the High Court of Justice, as to whether a hoarding was a “building” within the meaning of a covenant against erecting any building. By deed dated February 25, 1869, William Foale, conveyed two plots of ground in Kingston-upon-Hull, forming part of a residential estate, to the defendant, Fraser, in fee, Fraser covenanting with Foale, his heirs and assigns, to observe certain covenants entered into by Foale when he purchased the property, and therein stated as follows:—“That any building which shall hereafter be erected upon the said piece or parcel of land secondly hereinbefore described fronting the Spring Bank aforesaid shall be at least 36 feet in height from the level of the said flagged footpath, and shall have a stuccoed or cemented front and a slated roof; and that any building which shall hereafter be erected on the said piece or parcel of land firstly hereinbefore described shall be at least 22 feet from the level of the said flagged footpath, and any buildings thereon which face the east shall have a stuccoed or cemented front, and any building facing the north shall be fronted with white stock bricks and have slated roofs, and such

buildings respectively shall be used only as dwelling-houses, and that no tenements or other outbuildings shall be erected upon the said pieces or parcels of ground or any part thereof respectively to be occupied as tenements or as courts or squares or otherwise separately from the said front messuages or dwelling-houses." In June 1892 the defendants, the Hull and Grimsby Bill-posting and Advertising Company, Limited, under a license from the defendant Fraser, erected on this land an immense hoarding of a most substantial character, supported by struts and outposts and from 12 feet to 14 feet in height, and used it as an advertising station. The plaintiff, Foster, the devisee in trust and executor of Foale, who had purchased other residential property adjoining that conveyed to Fraser, alleged that the covenants were intended as a protection to the estate, and complained that this hoarding was an annoyance to himself and his tenants and had depreciated, and would depreciate, the value and amenity of his property and of the estate generally. He accordingly brought this action for alleged breach of the covenants and for an injunction. The action now came on for trial.

Mr. Renshaw, Q.C., and Mr. Maidlow appeared for the plaintiff, and Mr. J. G. Wood for the defendants.

Mr. Justice Kekewich, after holding that the plaintiff took as assignee of Foale, and as such was entitled to maintain the action, said that this was unquestionably a residential property, and the first question was whether this covenant was originally intended for the benefit of the property. Upon that he had not the slightest doubt. And upon the evidence it was clear that it was prejudicial to the property to have a hoarding covered with advertisements. It was one of those things which were not agreeable to residential property, and, in his opinion, the covenant was reasonable as a protection to residents in the neighbourhood. So far he was in the plaintiff's favour. Then the remaining question was, Was this hoarding a "building" within the meaning of this covenant? That was not at all an easy question to determine, and for this reason. The covenant was not expressed in language as full as one could wish, and no doubt the construction was rendered a little more difficult, as it did not show the protection which it was intended to effect. It was not stated what were the purposes for which the covenant was put in; it was put in without any introduction or explanation. The grantee might turn the land into a market garden or anything else. As long as he did not put up a building he might use it for any purpose whatever. There was no express covenant to build anything, but what the

covenant said was this:—"If you do build, the building shall be of a certain kind." Looking at the terms of the covenant, they were not applicable to a hoarding at all. The words did not point to anything of the kind, and accordingly his lordship held that such a hoarding as that in question was not a "building" within the covenant. The defence, therefore, succeeded, and there must be judgment for the defendants with costs.

PATENTS.

[This List of Patents is compiled specially for this Journal by Mr. G. H. Rayner, of the firm of Rayner & Co., Consulting Patent Agents, 37 Chancery Lane, London, W.C., from whom all particulars and information relating to Patents may be had gratuitously.]

APPLICATIONS FOR PATENTS.

10496. Richard Sutcliffe Blackburn, for "Improvements in the method of and apparatus for operating steam or other valves, for fire or other alarms, and for suitable purposes."

10499. Ernest Arthur Scammell, for "Improvements in filters."

10516. Edwin Frankling Oakley and John Lewis Devonport, for "An improved method of and apparatus for extinguishing fires in buildings and other places."

10530. David John Russell Duncan, for "Improvements in wheels, pulleys and the like."

10542. James Collins and Harry Rae, for "Improvements in handles for locks, latches and the like."

10549. David Lawley, for "Improvement in sash-fasteners and the same, to be used for similar purposes."

10649. Joseph Hamilton, for "Improvements in concrete and artificial stone mantelpieces."

10693. Thomas Hobbs, for "Improvements in sheave or pulley blocks."

10695. John Lewis Dubois, for "Improvements in cocks for water, gas, steam or other fluids."

10717. Charles Meason, for "Improvements in brass or other fenders and fire-dogs."

TRADE NOTES.

AT the meeting of the Leeds Corporate Buildings Committee, it was decided to invite five Leeds firms to send in tenders for the redecoration of the Borough and Crown Courts at the Town Hall.

AT the meeting of the Bilston Township Commissioners, Mr. L. B. Cole, chairman, presiding, a discussion took place with regard to the provision of an infectious hospital at a cost of 2,500*l*. Ultimately the matter was referred to the General Purposes Committee, who were instructed to advertise for tenders.

THE contract for the proposed new church of St. Peter's, Staines, to be built at the sole expense of Sir Edward Clarke, Q.C., has been placed in the hands of Messrs. Goddard & Sons, builders, of Farnham. The cost of the building, inclusive of heating and lighting, but exclusive of the two top stages of the tower, will be 6,500*l*. The architect is Mr. G. H. Fellows Pryne, F.R.I.B.A., of Westminster. A sketch of the interior of this church, with its large constructional rood screen, is exhibited in this year's Academy.

THE tender of Mr. James Julian, builder, of Truro, for the re-restoration of St. Stephen's Church, near Grampound Road, Cornwall, has been accepted. The re-restoration will be carried

out from designs and under the superintendence of Mr. G. H. Fellowes Prynne, Westminster, at a cost of about 1,100*l*.

WE notice that the Homacoustic Speaking Tube Company are popularising their system and meeting with deserving encouragement in installing their apparatus in some of the most prominent of our public buildings, some of the most recent works being the Press Association's new offices, the Institute of Chartered Accountants (the inauguration of which recently took place), the new premises of Pearson's Weekly, Limited, Henrietta Street, Covent Garden, Kelly & Co.'s (of directory fame) new building in Holborn, the Gresham Life Assurance offices in the Poultry, Cheapside, and many others. We understand that in the latter work over 3,000 feet of tubing has been employed in the installation, some of the tubes being considerably over 250 feet long. The system has given the utmost satisfaction to the officers and directors of the latter company, who, to show their appreciation, have added one more to the Homacoustic Co.'s long list of testimonials. The work was carried out under the supervision and direction of Mr. Creed, Finsbury Square. The system, which is rapidly displacing short-distance telephones, may be seen at the company's extensive show-rooms in actual efficient working at 22 Queen Street, Cheapside.

BUILDING AND BUILDERS.

THE Vestry of Islington have agreed to give 6,500*l*. towards rebuilding Highgate Archway. The total cost will be 27,000*l*., to which the Ecclesiastical Commissioners will give 1,000*l*.; the Middlesex County Council, 13,000*l*.; and the London County Council, 6,500*l*.

THE annual trip of the Glasgow Master Masons' Association has just taken place. Leaving by an early train for Melrose, the party drove to Abbotsford, thence to Dryburgh Abbey, returning to Melrose in the afternoon. The trade was well represented, and deputations were present from the Master Builders' Associations of Edinburgh and Dundee. The president of the Glasgow Institute of Architects and a representative from the Glasgow Institute of Measurers were also present. The party had lunch on arrival, and subsequently dined at the George and Abbotsford Hotel, Melrose.

THE large builders' premises of Messrs. William Cubitt & Sons, in the Gray's Inn Road, caught fire on Saturday, and were in great part destroyed.

At the meeting of the Mid Ross district committee, held at Dingwall, Messrs. Crouch & Hogg, engineers, Glasgow, submitted plans of proposed new bridges to be erected over the rivers Conon and Orrin, as the present wooden structures have become unsound. The designs submitted included steel girder and wooden bridges, the former to cost about 3,000*l*. for the Conon and 2,000*l*. for the Orrin. The wooden bridges were estimated to cost about a third of these figures respectively. It was agreed to adopt the steel structures, but final settlement of the matter will be delayed till October. In course of discussion it was intimated that the larger bridge over the Conon had been notified as dangerous during the past twenty years.

SUBJECT to certain conditions formulated by Sir Thomas Storey, the building known as the Storey Institute, Lancaster, is to be handed over to the Lancaster Corporation on July 1 next for the benefit of the town. It has also been decided to utilise forthwith a portion of the premises as a public free library. The Institute, which has cost the donor about 20,000*l*., includes an art gallery, schools of science and art, a music-room, a lecture theatre, a library and reading-room, besides facilities for conducting technical and other classes.

VARIETIES.

THE formal inauguration of the newly-constructed auxiliary water-supply for Perth has just taken place in presence of a large attendance of the commissioners and the officials of the town. The new works have cost about 4,000*l*.

THE *Leeds Mercury* says:—The death has occurred at his residence at Blackburn of James Sharples, the working blacksmith, who some forty years ago made a great stir in the art world by engraving the well-known picture of the forge with a self-made tool and entirely without instruction. Sharples's task occupied his leisure time for five years. It was only when he took the plate to the engravers that he first saw an engraved plate produced by any other man. The deceased, who had suffered from heart disease for some time, was sixty-seven years old.

BEFORE Mr. Justice Grantham and a jury a Mr. Jordan and his wife claimed damages from the landlord of a house in Leytonstone, named Morley, on the ground that the latter had made a false statement as to the drains of the house being in good order; and also for false imprisonment. When the

plaintiff moved out of the house in consequence of bad drainage and of the illness which it caused, he was in arrear with his rent, and it was alleged that the defendant gave Mrs. Jordan into the custody of a policeman. The jury awarded 60*l.* damages.

THE Secretary of the Home Arts and Industries Association, Royal Albert Hall, reminds us of the annual exhibition of works held in the minor arts, wood-carving, repoussé work in metal, basket making, &c. Assistance in the shape of voluntary help or money is desired to carry on the work.

OUR attention is called by Messrs. Marion & Co. to "Downey's Art Studies," a publication which they are just issuing, and which is a new departure and interesting from two points of view. In photographic journals and photographic circles it is a much debated point whether a photograph can be artistic, but Messrs. Marion and Co. think these publications produced by Messrs. W. & D. Downey go far to show that a very near approach may be made to art where photography is used by a master. However that may be, the public at least seem to think they have a good thing offered to them, to judge by their eager purchases. The other point which is interesting is the one showing the power photography gives to produce a good printing plate, and at a cost that permits of these pictures being published at the low prices given in list. It must be understood that these productions are printed in a very similar manner to engravings, and are quite as permanent.

SOCIETY OF ARTS.

THE Council have awarded the Society's Silver Medal to the following readers of papers during the session 1892-93:—

At the ordinary meetings:—

To James Douglas, for his paper on "The Copper Resources of the United States."

To William Key, for his paper on "The Purification of the Air Supply to Public Buildings and Dwellings."

To Professor Frank Clowes, D.Sc., for his paper on "The Detection and Estimation of small proportions of Inflammable Gas or Vapour in the Air."

To Thomas R. Dallmeyer, for his paper on "Tele-photography."

To Gisbert Kapp, for his paper on "Some Economic Points in connection with Electric Supply."

To H. van der Weyde, for his paper on "The Pictorial Modification of Photographic Perspective by the use of the Photo-corrector or Visual Lenses in Portraiture and Landscape."

In the Indian section:—

To Herbert Thirkell White, I.C.S. (Burma), C.I.E., for his paper on "Upper Burma under British Rule."

To J. Barr Robertson, for his paper on "The Currency Problem."

To Sir Juland Danvers, K.C.S.I., for his paper on "Indian Manufactures: their Present State and Prospects."

In the Foreign and Colonial section:—

To Cecil Fane, for his paper on "Newfoundland."

To H. A. McPherson, for his paper on the "Philippine Islands."

To W. B. Perceval, agent-general for New Zealand, for his paper on "Aspects of Federation from a Colonial's Point of View."

In the Applied Art section:—

To Hugh Stannus, F.R.I.B.A., for his paper on "The Theory of 'Storiation' in Art."

To Wilton P. Rix, for his paper on "Pottery Glazes: their Classification and Decorative Value in Ceramic Design."

To Professor W. M. Flinders Petrie, for his paper on "Primitive Art in Egypt."

A vote of thanks was passed to Sir Edward Braddon and Mr. Dredge—who, as members of Council, were ineligible to receive medal—for the following papers:—

To Sir Edward Braddon, K.C.M.G., agent-general for Tasmania, for his papers on "Australasia as a Field for Anglo-Indian Colonisation," and "Russia as a Field for Tourists."

To James Dredge, for his paper on "The Chicago Exhibition, 1893."

THE Forestry section of the Gardening and Forestry Exhibition is now fairly complete, and nearly all the exhibits promised by official bodies and private individuals are now *en evidence*. Among them will be found a most interesting consignment from Balmoral, lent by the Queen, as well as a vast number of examples of what may be termed the curiosities of forestry, illustrating abnormal growths and eccentricities of tree life. Other exhibits set forth the varying effects on timber of salt and fresh water, and the ravages of insects.

WALL INLET VENTILATOR

WITH INDICATORS

(DARRAH'S PATENT).

Incorrect Indication Impossible. Only One Action.

In the above we have introduced a most important improvement. It consists of an Enamelled Indicator, showing from any position when the Ventilator is open or shut. By this means all uncertainty is removed, and any person can see at a glance whether the ventilator is acting or not. The ordinary ventilator is often rendered quite useless by being shut off when it is supposed to be open, the only means of ascertaining the fact for a certainty being by holding the hand over the inlet, which is often difficult of access.

We shall be pleased to send a Model of Full-sized Ventilator on approval, carriage paid to any Architect for inspection.

BAXENDALE & CO.,

Miller Street, Manchester, and Hanover Street, Edinburgh.

PERFECTION IN BATHS.

Why our Patent Copper Bath is the Best.

It will last a lifetime. | No cracking of enamel. | No repainting.

It is quite open and accessible; no accumulation of impurities possible.

It does not chill the Water as Iron and Porcelain Baths do.

The Patent Tinning on the Copper resembles Electro-plate.

It will lend itself to any Style of Decoration.

It is for Quality, Durability and Appearance the Cheapest Bath in Market.

SUITABLE ALIKE FOR A MANSION OR A COTTAGE.

Prices on Application.

THE SANITARY BATH CO., LIM., 12 MILLER STREET, HIGH STREET, CAMDEN TOWN, N.

HOLBORN AND STRAND IMPROVEMENT SCHEME.

THE following is the description accompanying the plan for this improvement by Mr. C. J. Shoppee, president of the Surveyors' Institution:—The new street would commence at the end of Theobald's Road and be continued southwards, 100 feet wide, to Holborn, with a circus 250 feet diameter at Holborn. Thence through Lincoln's Inn Fields to a second circus, with spur streets east and west 70 feet wide, one leading to Catherine Street and one to St. Clement Danes Church, with a street 60 feet wide leading directly to the church of St. Mary-le-Strand. From the circus in Lincoln's Inn Fields the street would be inclined towards the Strand, 70 feet wide, and pass under a bridge or viaduct at Surrey Street to the level of the approach to the Victoria Embankment. The buildings on the west side of Lincoln's Inn Fields would remain, their forecourts being added to the new street. It is proposed to continue the present street on the east side of Lincoln's Inn Fields to Holborn and to improve the access to Waterloo Bridge by widening a portion of the Strand.

ENGINEERING WORKS IN GREECE.

IN recent years many great engineering works have been projected, the *Glasgow Herald* says, in Greece, and some of them have been carried to completion. When we first knew the country its only railway was a short one uniting its capital with its port of the Piræus, but a few years ago it was proposed to connect Athens with the European railway system through Salonica, and this work has been in part carried out. Besides two shorter lines, there is also now the long railway from Athens across the Isthmus and along the southern shore of the Gulf of Corinth to the north-western extremity of the Peloponnesus. In addition to these works and the draining of Lake Copais, from which the Romans used to obtain their favourite eels, an old project of the Emperor Nero has been revived, and the Isthmus of Corinth has been cut by a canal which will be opened in a few weeks. To the early Greeks the need for this canal was not apparent, for Greece had its face turned towards the east, and in its youth its most active intercourse was over the Ægean Sea. At a later period some of its more enterprising states founded colonies on the Adriatic and elsewhere, but in its early days Greece regarded the Ægean as

its great sea—its archipelago, and Greek history of that period deals mainly with its shores. Even now it is interesting to note how eastern and western navigation are separated at the Isthmus, and how at its one side there are craft of various kinds, but all Oriental in rig, their varieties nearly all bearing Turkish names, but the fashion of their hull, spars and sails such as is described in the pages of Homer; while on the other side there are no levantine craft, but all are western in style, and the lateen, or latin, sail is predominant.

In early times the Isthmus was regarded, not as the barrier between two seas, but as the way between the Peloponnesus and the mainland; and Corinth probably first acquired importance from her position enabling her to control this road. When she had her colonies in the Ionian Islands she must have found that the Isthmus was a useful barrier against the fleet of Athens during the Peloponnesian war. But all these things were changed when Rome had conquered Greece and the East, and when practically the whole navigation and commerce of the Mediterranean fell under one control. Then Roman ships and galleys would find the rough passage round the Peloponnesus both difficult and dangerous, and a great part of the trade between the east and west would still be carried on across the Isthmus. This commerce raised Corinth to the height of its wealth, although the glory of its independence had departed. The Emperor Nero proposed to facilitate trade by making a waterway through the Isthmus. The work was actually begun. Many pits were sunk along the line of the proposed canal and excavations were opened at the eastern end. But there the work was abandoned, and history does not say why Nero did not complete his project.

About twelve years ago this old scheme was revived with vigour, but the enterprise had many financial vicissitudes, and it is only now that the design is about to be completed. The route for the canal chosen by modern engineers is exactly that marked out in Nero's time, and although this is not the line involving least actual cutting, yet it is that in which the minimum of surface water will have to be dealt with, and thus it is interesting to notice how those ancient Roman engineers must have weighed every consideration in such a work as this. The Isthmus is saddle-backed in form, and the greatest depth of cutting will be about 280 feet, while the length of the canal is $4\frac{1}{2}$ miles.

The traveller now going to Athens will probably select the route by Brindisi and Corinth as at once the most interesting and most expeditious. After visiting the lovely island of Corfu,

he will sail by Cephalonia, and then by Ithaca, the island of the wily and wandering Ulysses, and the home of the faithful and patient Penelope. Then he will admire Zante, the most beautiful and fertile of the Ionian group, but which seems to be on the focus of the destructive earthquakes which have shaken the shores of the Corinthian gulf at intervals since the earliest times, and which has even now suffered terribly from one of these catastrophes. Anon the traveller will arrive at Patras, and amid the clamour of boatmen and porters will be landed at the railway station.

The railway from Patras to Corinth runs along a flat belt of land between the sea and the mountains, which form the northern wall of the Peloponnesus. It does not yield in beauty to any line, not even to that along the Genoese Riviera, and in classic interest it excels them all. It passes among orange groves and vineyards and feathery palm-trees, while the mountains, close on the right hand, rapidly change in form and colour as the train moves on. Occasionally a mountain stream leaps from the high cliffs, and, falling in spray in the gardens below, breaks up the sunshine into bands of rainbow colour. On the left hand one has glimpses of the sea through the foliage, while sometimes the railway crosses the head of a shingly bay, and the wavelets of the gulf roll the pebbles almost to one's feet. Or a long, narrow creek, running far into the land, is crossed. It is packed full of picturesque lateen-sailed fishing-boats, while a little village half hides, half shows itself from among the trees. Scenes of classic interest are constantly being passed close at hand, while away across the gulf towers the great snow-capped Mount Parnassus, the haunt of the Muses, and on its flank is Delphi, the place of the most celebrated of ancient oracles. The little inlet, where its port of Krissa stood, can just be distinguished, and there is hardly time to recall to memory the great sea-battle which the fleets of Athens and Corinth so fiercely contested there, ere one's interest is attracted by some new scene.

There is a railway station at New Corinth, where used to be a port of the ancient city of the same name. The site of the latter town is about a mile to the right, and on a little plateau about 300 feet above the level of the sea. It commands a beautiful view down the Corinthian gulf, and of the mountains on both its coasts. The town has disappeared, all but seven columns of a Doric temple. Behind rises the Acro-Corinthus, a great rock which has always been a stronghold, and which played its part in the Greek War of Independence. Athens can be seen from its summit.

The journey across the Isthmus is not so interesting now as it used to be by coach, for then there was time to stop and examine the remains of the Stadium where the Isthmian games were held, and to inspect the line of the great wall which ran across from sea to sea, and which the Peloponnesian States used to combine to defend, but now the railway drags one on, and no halt is made. The view from the summit of the Isthmus is very fine. Towards the east stretch the waters of the Saronic Gulf, with its rugged, winding shores, and its surface broken by numerous islands, among which Salamis and Ægina are prominent, and on the west lies the Gulf of Corinth, bounded on both sides by bold mountain ranges. The land around is a mass of mountains, with a few narrow fertile valleys, and is a fair example of the soil of Greece.

After leaving Kalamaki on the eastern side of the Isthmus, the railway passes round a shoulder of Mount Gerania, and approaches the celebrated pass where the giant Sciron opposed the passage of Theseus into Attica. Here the mountains incroach on the sea, and the line rises to a considerable height. Far beneath one's feet the waters of the gulf are lazily lapping, seeming a delicate green colour under the bright blue sky and over the yellow sand.

The considerable town of Megara, which used to contend with Athens until it was definitely humbled by its great neighbour, is reached. Here the peasant women wear the most picturesque costumes of any in Greece, and many visitors come from Athens to see them dance at their great yearly festival. The train halts at Eleusis, where the mysteries used to be celebrated, and one sees the way over which the sacred Panathenaic procession passed, and the marks of its chariot-wheels in the rock. Looking out through the narrow strait between Salamis and the mainland, one may descry the place where the great sea-battle was fought between the Athenians and the fleet of Xerxes—a battle which in its issues for us was one of the most momentous ever contested.

The railway does not cross the mountains by the Pass of Daphne as the road does by which the Panathenaic procession travelled, but it winds away far to the north of Mount Aijaleos, and crawls laboriously over a spur of the mountains. At last the plain of Attica comes into view, surrounded by its great mountains of Parnes, Pentelieus, and Hymettus, and verdant with its olive groves. Beside two hills on the farther side of the green foliage is a town with some important-looking modern buildings. On one of the hills are some columns and ruined walls. It is Athens and its Acropolis.

NEW CATALOGUES.

"RANSOME'S Wood-working Machinery" appears on the cover of a large and handsome illustrated catalogue of patented and improved wood-working machinery, comprising general and special wood-working machinery, machinery for sharpening, setting and adjusting saws and cutters, motive-power, shafting, pulleys, belting, &c., saw-mill appliances and accessories, saws, cutters, augers, tools and cooperage machinery. For facilitating the working of their business the Chelsea Engineering Works has been amalgamated with the Battersea foundry. The two businesses, hitherto known as A. Ransome & Co., and Ransome, Josselyn & Woods, respectively, have been owned for some years practically by the same partners, although the management has been individual. In future, however, they will be together known as A. Ransome & Co., Limited. The Stanley Works, Chelsea, are exclusively devoted to the manufacture of wood-working machinery and all appertaining to the same. At the foundry high-class and difficult castings are manufactured which foundries with only ordinary appliances could not cope with. Thirty-nine years' experience enables this firm to consider itself far ahead of all others in this branch of engineering. The catalogue contains between 230 and 240 pages, though it does not pretend to be an exhaustive list of the manufactures of the firm, but rather to be a thoroughly representative catalogue. As it is, however, it forms the largest treatise on wood-working machinery yet published. In addition, it is more than a mere illustrated list. The descriptions, the appliances, machinery, &c., that accompany the illustrations would probably give more knowledge on the subject of machinery of all kinds in a short time than could be acquired in other ways. Many also whose business is concerned with woodwork will find a large number of machines for varied purposes that they have not supposed had yet been invented. Appliances also are illustrated and described that will meet all the wants of the Canadian or

American lumberman, including even pioneer forest railways. Before putting to use all the contrivances for fashioning wood, sawing, planing, mortising machines, &c., the timber must be won from the forest, felled and transported to the saw-mills, and few persons would care to write down a list of all the tools and machinery that may be employed on any forest tree from its felling till it results in finished woodwork. We may add in conclusion that the catalogue illustrates, describes and codes between 700 and 800 machines, adaptations of machines and appliances for the conversion or in connection with the conversion of wood. It contains 441 wood-block illustrations, most of which are new and cut for the present edition.

We have received a very compendious illustrated list from Mr. John Clark, of High Street, New Oxford Street, W. The book comprises two sections, and traverses with considerable useful detail innumerable articles that are of constant requisition in house furnishing in the form of wire goods. One of the sections is more particularly devoted to fireplace furniture and accessories. Mr. Clark has long made a specialty of brass fire-guards and brass wire fenders. Specimens for all purposes are illustrated with a pleasing choice in regard of design. Curbs, fenders, fire-guards, &c., are not only used as a finish as regards appearance, but their *raison d'être* is to give safety. However, there are many special kinds which are termed "safety" fenders, &c., to distinguish them as being improved articles for special purposes; as, for instance, for nurseries, bedrooms, &c. There are, also, the upholstered seat-fenders for clubs, billiard-rooms and the like. Polished and lacquered brass kerbs appear in a number of different and pleasing patterns. There is a great scope for ornamental effect in fancy fireguards, and Mr. Clark has taken full advantage of such possibility to produce numberless specimens, and it is hard to pick out any one, whether of the hanging or standing fireguards, for special reference. Individual taste must guide selection. Among them, as may be expected, of course, are illustrated many standing fireguards, with stained and leaded glass centres. There are also specimens of the automatic fireguard and dumb waiter combined—often a very useful appliance. The other section relates to the innumerable wirework goods for the garden, the house, birdcages, aviaries and bird palaces also, it may be said, included. Kitchen requisites include sieves, wire-lamp shade-holders, meat safes, eel traps, traps for mice and rats, appliances useful for cooking purposes. Builders' screens and sieves for masons and plasterers, agricultural sieves, &c., are also quoted. The

JAMES HILL & CO., 100^A Queen Victoria St., London, E.C.

designs for window blinds in wove-wire are shown, as also designs in stained-glass, ornamental wirework goods for the garden, conservatory and house, flower-stands, hanging baskets, trellis-work, fencing, pheasantries, rosaries, coil cases, &c. With this résumé we must leave those interested to consult the catalogue, or their imagination, as to other goods that space will not permit to allude to in detail.

UNDER date April, 1893, Mr. John Jones, 40 Sydney Street, Chelsea, S.W., has issued a revised edition of sanitary specialties to submit to the notice of architects, surveyors, engineers, medical officers of health, builders, sanitary inspectors, &c. In revising the edition it has been considerably added to. The goods are recommended from practical tests, and attention is invited to several improvements made in Jones's patent goods. For testing drains with water the stopper must be used. Jones's patent drain and pipe stopper is an ingenious device, the principle depending on the use of a bag which is inflated. His patent expanding screw-stopper consists of a rubber ring between two discs of galvanised iron with or without centre outlet, also with centre outlet and indicator attached to gauge the fall or detect leakage. These have all been premiated at exhibitions. Next are shown and described several varieties of patent air-tight manhole-covers with automatic seal, Jones's patent drain ventilation for deep manholes for house drainage, &c., patent air inlet ventilators for house-drains (all of these have been premiated), patent chimney-pots, patent branch inlet or junction pipes, patent English-made pedestal closets, Crosse's invisible flush fresh-air inlet ventilators for houses, stables, cowsheds, &c., as supplied to the London General Omnibus Company and having received a gold medal, new patent silent valveless flush cistern suitable for all closets and approved by the water companies, also Jones's drain-clearing machinery.

WE have just received from Messrs. Baird, Thompson & Co. illustrated lists of the Baird-Thompson patent air propeller, for ventilating, cooling, drying or removing heated air, steam and dust, or for any other purpose depending upon the movement of air in volume, also for combined ventilating and warming, which is estimated to give a greater volume of air, requires less power than any other propeller. Also of the Baird-Thompson improved system of positive ventilation for ships, yachts, &c., of which they are patentees and sole proprietors. It is a combination of upcast and downcast ventilators, which, in conjunction with an arrangement of pipes delivering compressed air, create an induced current, con-

stantly changing the atmosphere in ships' holds and between decks, so as to maintain it in a continual state of purity. When applied to passengers' quarters it is so adapted that all possibility of draught is entirely avoided. These currents being produced by natural means, but independent of the fluctuating power of the wind, the efficiency of the ventilation cannot be impaired, and is maintained under all circumstances and conditions. It is simple in its application and economical, both in first cost and maintenance. Air is compressed by means of the Baird-Thompson specially-constructed patent compressed air-engine, fixed in any convenient part of the ship, and is conveyed in pipes of small area to the part requiring ventilation, and there allowed to escape through our patent "Grahtryx" air nozzle, fixed at the mouth of the ventilating shaft, so as either to exhaust foul air or impel in fresh air, as may be required.

CHESTER ROYAL SHOW.

Tangyes, Limited.

THERE is a fine exhibit of Tangyes' engines and tools at Chester Show. Since the introduction of Tangyes' Gas-engine (Pinkney's patent), large numbers have been sold and universal satisfaction given by them; the sizes varying from $\frac{1}{2}$ horse-power to 115 horse-power in use for driving machinery of very delicate construction. Owing to their special construction defects known to exist in other gas-engines are entirely done away with, the result being freedom from shock, steady running, durable working parts, perfect lubrication, proportionate distribution of metal to resist all possible strains, large working surfaces, hand-starting perfectly easy, durable ignition tube, self-adjusting timing valve, and for large engines a positive mechanical pressure starter. Several later improvements have been added which makes these engines exceedingly economical when running at high and low speeds, so that engines required to do ordinary work in the day time can by one simple movement be converted into an electric-lighting engine at night when required. Also engines fitted with a special arrangement of lubricators can be left to run for a whole week without the slightest attention. One has been running already on a sewerage system for several months without a hitch. Besides applying these engines for driving dynamos for electric lighting, printing machinery, &c., Messrs. Tangye are devoting much time and capital to the further development of larger size gas-engines to work with producer-gas for driving large factories

KALLKOLITH.

NEW PATENT PRIMING AND STAIN.

Acknowledged by experts of nearly every country to be one of the most important inventions of the Nineteenth Century.

PATENTED IN
England,
Belgium,
France,
Germany,
Italy.

TRADE MARK.

PATENTED IN
Austria-
Hungary,
Denmark,
United
States
of America.

KALLKOLITH is one of the most marvellous inventions of the present age, and is used as a priming in place of the now almost obsolete oil-colour. It produces an exquisite smoothness, combined with great durability, and amalgamates thoroughly with wood, iron, cement, stone, plastering, &c.

CHEAPNESS.—It saves at least 100 per cent. in comparison with any other priming now in use, being less than half the weight.

ECONOMY is manifested by the fact that one 14-lb. tin of **KALLKOLITH** goes further than three times the same quantity of oil-colour.

DRYING POWERS.—It dries within one to two hours, thereby greatly facilitating the quick dispatch of labour.

DURABILITY.—Where **KALLKOLITH** is used it imparts an amount of durability to all oil-colours used upon it which has never yet been obtained, and one of the most important advantage in its use is that the paint put upon it does not blister.

PAPER-HANGING.—Walls prepared with **KALLKOLITH**, thinned with seven parts of water, give a great additional advantage to the hanging of all descriptions of papers.

TESTIMONIALS.

21 New Bridge Street, London, E.C.: February 23, 1886.
I have had some trials made with the **KALLKOLITH** during the past few weeks, the results of which are very satisfactory. The **KALLKOLITH** is to be used as the first coat of paint on wood and other substances, and is of such a nature that the ordinary work in preparing for paint is considerably lessened, and the usual number of given coats now reduced, and, once fairly introduced in the market, I am certain there will be a large sale.
J. WM. STEVENS, Architect and Surveyor.

75 Newman Street, Oxford Street, W.: Feb. 15, 1887.
We are pleased to tell you that the **KALLKOLITH** supplied to us has been fairly tried, and we find that it answers all that you claim for it.
CAMPBELL, SMITH & CO.

requiring several hundreds of horse-power. They have at the show:—

25 H.-P. nom., indicating 62 H.-P.

7 "	"	"	15 "	driving saw bench.
5 "	"	"	10.5 "	driving 5-foot geared three-throw pump.
3 "	"	"	6.5 "	driving dynamo.
1.5 "	"	"	2.5 "	driving friction hoist, self-contained.

Tangyes' Girder Steam-engine, having steam cylinder 16 inches diameter and a stroke of 32 feet, is typical of its series, and has been revised throughout to stand a working pressure of 100 lbs. per square inch; all the bearing surfaces are most simple, and where necessary the bearings are lined with "plastic" metal, and are adjustable. The bed is of the well-known "girder" form, and is of strong box section; it has the main pedestal and crosshead guides cast with it. The crosshead guides are bored and the flange faced at one operation, insuring accuracy in the alignment. The cylinder and the steam chest are steam-jacketed and lagged; the slide valve is fitted with the Tangye-Johnson patent automatic cut-off gear, which is now widely known as a simple, reliable and economical cut-off gear, and being without the complication of detail found in many cut-off gears is welcomed by the ordinary engineman. Economy has not been sacrificed, however, to simplicity, and this gear will compare favourably with any other. This gear can be fitted to most of the various types of engines made by Tangyes, Limited, and is strongly recommended for use where the load is at all variable. The lubrication is effective, the cylinder being fitted with a Tangyes' sight-feed lubricator, and all the working parts with conveniently-placed oil boxes. The automatic gear is controlled by a Tangyes' improved "Porter" governor, driven by two bolts, and the whole of the details bear evidence to the great care which has been exercised in designing the engine.

Tangyes' 12 by 8 by 24-inch "Special" Steam Pump is a good example of a type which is found all over the world, and which is made in hundreds of combinations and for every conceivable duty. To meet the recent general rise in steam pressures, this pump is now made from entirely new patterns, the steam cylinders being strong enough for a working steam pressure of 100 lbs. per square inch and the pump for a total head of 300 feet. The "Special" pump is also made in other forms for heads of 600 feet and 1,000 feet, and for use in hydraulic work to pump against pressures up to

2½ tons per square inch. As economy of working is now demanded even in the simplest forms of steam-pumps, Tangyes, Limited, have compounded their various types, and, though not rivalling the economy of a high-class steam-engine, the compounding will be found to effect a considerable saving over the simple direct-acting pump type. The pump is suitable for rough work, as the working parts (with the exception of a small portion of the rod) are entirely under cover and protected from damage. Where it is necessary to condense the exhaust steam, this is done very effectively by the addition to the pump of Floyd's patent exhaust steam condenser. The steam tappets are very reliable, and are fitted with special adjustments. The pump glands are of Floyd's patent anti-friction stuffing-box type, and with them it is impossible to damage the rod by careless screwing down of the end gland. Various small improvements have been introduced, and the workmanship employed in the construction of the pump is of the highest order.

Tangyes' Horizontal Duplex Pump, having 6-inch steam cylinders, 4-inch water cylinders and strokes of 6 inches, made to work with and against a steam pressure of 160 lbs. per square inch, has been designed mainly for boiler feeding, where high steam pressures are usual. It is strongly made throughout, and great care is exercised to secure sound materials and good workmanship. In this respect it is far ahead of most types of duplex pumps on the market. The valves and seats are of gun-metal, the former working on central spindles fixed to the body of the pump, so that the heat of the valves has no tendency to loosen the seats. They are easily examined by removing the covers to the valve chambers. A handle is sometimes fitted to the pump to enable the boilers to be filled with water by hand, when not under pressure. Messrs. Tangye also make a large number of duplex pumps of various types suitable for heads of 300, 600 and 1,000 feet, and to work against hydraulic pressures of 500 lbs., 1 ton and 2 tons per square inch.

The Six-inch Sliding and Screw-cutting Lathe, made by Tangyes Machine Tool Company, Limited, with gap bed and strong double-gear head stock, has a large steel spindle running in conical bearings with the necks case-hardened and carefully ground. The bed is wide, to insure perfect steadiness when a heavy cut is being taken. The saddle has a quick return hand motion, and carries a compound slide rest arranged to swivel for conical turning, and is fitted with quick withdraw motion. The whole design is very strong, and the

Price 2s.—Office, 175 Strand, London, W.C.

LONDON AND GENERAL WATER PURIFYING COMPANY'S, LIMITED,

House Cistern, fitted with a Cistern Filter.

PATENT CISTERN FILTERS. Charged Solely with Animal Charcoal. Requiring, when once fixed, NO attention whatever, and superior to any others. Vide Professor Frankland's Reports to the Registrar-General, July 1866, November 1867, and May 1870. The *Lancet*, January 12, 1867.

Also, Testimonials from Dr. Hassall, September 23, 1863; the late Dr. Letheby, February 15, 1865, and December 1872.

Price, £1 10s. and upwards. Portable Filters on this System, £1 5s. to £3.

Patronised and used by Her Majesty the Queen at Osborne, by H.R.H. the Prince of Wales at Sandringham, by H.R.H. the Duke of Edinburgh at Eastwell, by H.R.H. the Duke of Connaught at Bagshot Park, by H.R.H. the Duke of Cambridge, the *élite* of the Medical Profession, and at the London, Middlesex, St. George's, St. Mary's, Consumption, Fever, and German Hospitals, and various Lunatic Asylums, Institutions, Breweries, &c., and at all the Schools established by the School Board for London. Pocket Filters, 4s., 6d. and 3s. each. Household and Fancy Filters, from 10s. Water-testing Apparatus for detecting Impurities in Water, 10s., 6d. and 2s. each.

157 STRAND, W.C. (Four Doors from Somerset House), LONDON.

Portable Cistern Filters.

bearing surfaces are large, so that the lathe will retain its accuracy for a lengthened period. The lathe supplied complete with face plates, change wheel, countershaft, with fast and loose pulleys, and a set of spanners.

The Circular Saw Bench, Size A, has the frame cast in one piece, and is of strong section. The table is accurately planed, and has rollers fitted at each end, and a loose gap plate to allow of the removal of the saw. The spindle runs in long bearings lined with anti-friction white metal, and is carried by a lever arm, which is raised and lowered by screw and hand wheel conveniently placed in the front of the machine. The face swivels for bevel sawing, and can be entirely removed when cross cutting.

Tangyes' 5 by 6 inch "Soho" Engine with Governor, mounted on a Tangyes' Colonial Boiler, is a compact arrangement especially suitable for country use, where wood or other inferior fuel is abundant. The engine is simple and well made, the governor being of the "Soho" type, which is so designed that in the event of the belt breaking or coming off the steam is shut off. The boiler has a large grate for wood burning, and has the furnace beneath the barrel, the flame passing along below the barrel and returning through the tubes to the chimney; in this way the heat is well absorbed. The casing is of steel, and is thoroughly protected with fire-bricks. The engine and boiler are sent out complete with feed pump, safety valve, stop valve, pressure gauge, water gauges, and all necessary steam and water pipes.

Robey & Co.

THE exhibits of Messrs. Robey & Co. include Robey & Co.'s horizontal steam engine, fitted with their patent automatic trip expansion gear—an engine of substantial construction, suitable for doing heavy work, and is at the same time provided with a high-class expansion gear for securing the greatest economy in fuel and perfect governing under varying loads. It is an engine which, on an estate, can be set to do thrashing, sawing and other work in the daytime with the greatest economy, and at night can be employed for driving a dynamo for electric illumination. Messrs. Robey & Co. have had a large experience with different varieties of expansion gear, which has enabled them to discern the weak points in each kind, and as a result they have produced their patent trip expansion gear, which is the simplest, most effective, most easily worked, and gives the most satisfactory results of any hitherto made. Messrs. Robey & Co.'s compound "Robey" engine and locomotive boiler com-

bined, fitted with patent automatic governor and link expansion gear, is a class of engine specially suitable for driving electric-light installations, mills, factories and other machinery where perfectly steady running is required, being very powerful for the space occupied, and working with perfect regularity with very varying loads, also extremely economical in fuel, consuming under 2 lb. of best Welsh coal per indicated horse-power per hour. The working parts are perfectly balanced so as to run safely at high speed. They have large wearing surfaces of ample size and run cool with heavy loads, and are well lubricated for long runs.

In addition to the above, Messrs. Robey & Co. exhibit specimens of their medium and long-stroke horizontal fixed engines, fitted with their patent automatic governor and link expansion gear; likewise their superior portable engines and wrought angle-iron framed thrashing and finishing machines, steel-framed stonebreakers, centrifugal pumps and high-speed vertical engine for electric-light work.

We may specially notice the patent gas and oil-engines on their stands; and respecting the patent gas-engine observe that the combustion chamber is of improved design, avoiding shock and insuring a pure change of gas and air in igniter passage, irrespective of the power given off. Valves can also be taken out without breaking any joints. The plan adopted for regulating the speed is a special feature, and is not only much simplified, but is also thoroughly reliable. Engines fitted with Robey & Co.'s governor will work with the same slight percentage of variation that their high-class steam-engines do; thus these gas-engines are specially suitable for driving dynamos and other machinery direct. The speed can be readily adjusted to either a low or high velocity.

Robey & Co.'s patent portable oil-engine is shown. The engine works on the Otto cycle, and is mounted on a strong steel cylindrical tank which contains the water required for cooling the cylinder, round which such water is forced by a circulating pump. A fore-carriage and travelling-wheels are placed under one end of this circulating tank. A chamber containing a week's supply of oil is rivetted under the other end of the water tank, and this forms a convenient means for carrying the axle of the hind travelling-wheels. The oil is pumped from this tank and forced against an internal vaporiser, where it is instantly converted into vapour, mixed with a due proportion of atmospheric air and exploded. The rise of pressure through the working stroke is gradual and violent shock avoided.

CARSON'S ANTI-CORROSION PAINT

THE WILSON ENGINEERING CO., LIM., 227^K HIGH HOLBORN, LONDON.

THE USE OF IRON AND STEEL FOR STRUCTURAL PURPOSES.*

THE subject that I have chosen for this evening, viz. "The Use of Iron and Steel as applied to Structural Purposes," is a very large one, and one that it is difficult to condense into the limits of a single paper. Moreover, owing to unforeseen circumstances, I have not been able to devote the amount of time to the preparation of the paper that I could wish to have done. I must therefore ask your indulgence for any defects, and I trust that at all events there may be some information contained therein that may prove of use to the younger members and students of the Association. With respect to its useful properties iron may be said to occupy the first place among metals. It is the strongest, is comparatively light, durable, easily worked, and being capable as it is of assuming the three forms of cast-iron, wrought-iron and steel, each of which has qualities suited to different purposes, it has a very wide field of use, and it is not too much to assert that it has been, in one of its three forms, an indispensable element in all the most important developments in the industrial progress of the human race. Chemically speaking, iron is one of the elements crystallising in the cubic system, the forms most generally observed being cubes or octahedra, the latter often in skeletal shapes and grouped into tree-like aggregates. Solid masses of iron when fused, which have not been hammered or subjected to pressure, show, when polished and etched, a granular crystalline surface, which shows this structure. It has a specific gravity of about 7.7, which may be reduced by cold rolling or wire drawing, but may be restored again by annealing. It becomes magnetic when brought into the field of a magnet or when surrounded by an electric coil. It may be volatilised at the temperature obtained by the electric arc, when it burns with the production of a dense orange-red smoke. The difference in the chemical composition of iron and steel is so small that it is extremely difficult to say how it affects their structure; in some cases so small an addition as 1 part in 1,000 of one-tenth per cent. of a foreign substance producing a marked difference in the structure and quality of the resulting metal. Practically the sole difference between

cast-iron, wrought-iron and steel lies in the amount of carbon which they respectively contain, and it cannot be said at what point the one ceases and the other begins, steel holding as it does an intermediate place in a series beginning with the most impure cast-iron, and ending with the softest and purest malleable iron. The following, however, may be taken as approximately defining the three forms of the metal:—Malleable or wrought-iron contains less than 0.2 per cent. of carbon, is infusible excepting in special furnaces, gives unsound castings when fused, cannot be hardened by sudden cooling from a red-heat, but can be welded and wrought into shape while hot. Steel includes all kinds of iron containing not more than 1.75 per cent. of carbon, these varying considerably in fusibility, hardness, susceptibility to tempering and malleability, the first two properties being increased by the increase of carbon, while the malleability is diminished. The limit of about 0.4 to 0.5 of carbon may be taken as that of ordinary malleable steel, above which come the more special qualities of tool and cutlery steel, which are chiefly valuable for their hardness. Cast-iron includes all iron containing more than 2 per cent. of carbon up to a maximum of about 4 per cent., is readily fusible at a temperature of 2,786 deg. Fahr., and, as its name implies, is used in the production of articles cast to patterns in moulds. There is another point to be noticed in considering the chemical composition of the three above-named forms of iron, and that is the condition in which the carbon exists; this applies especially to cast-iron and steel, and it has been shown by experiment to exist in two distinct forms, viz. the one in which it is wholly in chemical combination with the iron, and the other in which it exists separately in the form of graphite disseminated in dark scales through the mass of the metal. When it is in the former condition, the metal is hard, somewhat largely crystalline, uniform in structure, and of a silvery white colour. When in the latter the metal becomes softer, of a darker colour, assuming a general grey tint, the depth of which varies with the amount of carbon present in the graphitic state, and the structure becomes less uniform. The method of determining the amount of carbon and the form in which it exists belongs more to the science of metallurgy, but it is necessary to understand this much in order to follow intelligently the process of manufacture, which we will briefly glance at presently. The other most important elements which are found in iron generally are silicon, phosphorus and sulphur. The first-named is sometimes beneficial; the two last may generally be stated as

wholly prejudicial, although the effect they produce is largely influenced by the amount of silicon or carbon present. This is often used with iron, chiefly to eliminate other impurities, and its general effect is to increase the tenacity and malleability of the metal, while that of phosphorus and sulphur is to make it brittle and unreliable, in the case of steel so small a quantity as 0.1 per cent. being the maximum amount allowable, although for fine castings a metal high in phosphorus is sometimes used where strength is not required, owing to the fluidity being increased by its presence. In the manufacture of iron as carried on now the first product that comes from the furnace is cast-iron, or, as it is commercially called, "pig" iron, from its being cast into a series of moulds known as "pigs." The ore, which consists chiefly of iron in combination with oxygen or with carbonic acid, is thrown into a large shaft after being mixed with sufficient limestone to remove the silicious matter and fuel enough to produce the required heat. The mixture is fed into the furnace in successive charges, and the fuel, assisted by a powerful blast, gradually raises the heat until the charge is in a state of fusion; chemical changes take place, the limestone and silica, together with a small portion of the iron oxide forming a fusible slag, which is drawn off from the furnace and thrown away. The iron oxide is reduced, and the metallic iron, being in a liquid state, falls to the bottom of the furnace, and is there tapped off into the moulds or pigs. The metal produced in its descent takes up a certain amount of carbon and silicon from the other constituents of the ore, together with phosphorus and sulphur, and is either white or grey, according to the manner in which the furnace is worked. The next process in the production of wrought-iron (and until comparatively recently in the manufacture of steel also) is that known as "puddling," and consists in oxidising the carbon and impurities, and separating them from the iron by heating the pig metal in contact with air and iron oxide. And it may here be mentioned, for the benefit of the younger members, that an "oxide" is a chemical combination of a substance and the gas oxygen, as with iron producing the familiar form of iron rust or with silicon forming quartz. During the operation a certain amount of slag is formed, and as the metal becomes infusible at the temperature of the furnace in proportion as the carbon is removed, this slag remains entangled in the mass, and has to be squeezed out, which is done under heavy hammers or hydraulic presses, some of the latter now in use being of a very large size, one which is in use at Cammell's Steelworks, at Sheffield,

being capable of exerting a pressure of 4,000 tons. When the slag is squeezed out, the lump of iron or "bloom," as it is called, is taken to a series of rolls, and in passing through these is gradually elongated and rolled into the desired shape, either into bars, angle iron, channel iron, rolled joists, &c. During this process an important change takes place in its structure, viz. the elongation of the crystals in the direction of the length of the bar, producing a fibrous texture and increasing the tensile strength to a great degree. We shall have occasion to refer to this later on, and to the property it has under certain conditions of reassuming the crystalline form which is the cause of many of the failures in iron structures. The next process is the production of blister steel from the wrought-iron by heating the bars in contact with charcoal for a certain time, thereby making it take up some more carbon. These bars are then broken up and melted in close crucibles and cast into ingots, which are then rolled out in the same way as the wrought-iron. As this steel is too expensive to be used for any purpose excepting where comparatively small quantities are needed, I will not dwell any further upon it, but will briefly describe the two most important methods of making steel directly from the cast-iron and by which nearly all the "steel" used for structural purposes is manufactured, viz. the "Bessemer" and the "Siemens" or "Siemens-Martin" processes. Each of these methods is again divided into the "acid" and the "basic." First made public at the Cheltenham meeting of the British Association, 1856, though not brought into workable condition for some years afterwards, the Bessemer "acid" process consists in melting the purest pig-iron obtainable and running it into a "converter," or iron vessel, lined with fire-clay and provided with nozzles in the bottom through which air is forced in large quantities, thus effecting the rapid oxidation and consequent combustion of carbon, silicon and certain other substances present in the pig-iron. It is found that a very high temperature is developed during the process, which is sufficient to keep liquid the resulting decarburised iron, which is at the close of the operation cast into ingots ready for rolling. The increase of temperature goes on progressively from the time the blast is turned on until it is again shut off. At the commencement of "the blow" the silicon and any manganese present are attacked, and when these are oxidised the action on the carbon begins. This period is marked by a rush of white hot flame and violent agitation of the molten mass; if the blowing be continued after the carbon is all burnt out the heat will be kept up by the combustion of the iron itself, which will become brittle and will possess all the

GILBERT WOOD & CO., 175 STRAND, LONDON, W.C.

properties of "burnt" iron. It can, however, be remedied by adding appropriate carbonising materials. Experience has shown that to obtain steel of good quality by this process the pig-iron employed must be exceptionally pure and free especially from phosphorus, sulphur and copper, as these substances are only slightly acted upon by the blast. Within certain limits silicon and manganese are however desirable, as they are completely oxidised, and assist in maintaining the heat in the converter. The action may be stopped when the carbon is brought down to the required percentage, or as is usually done now, the whole of the carbon may be burnt out, and at the end of the "blow" a compound of iron and manganese containing a large percentage of carbon is added in sufficient quantity to give the required percentage to the whole mass. This method of manufacturing steel has been brought to great perfection, but depending as it does upon the initial purity of the pig-iron used and the limited quantity of very pure iron of this sort, it follows that either only a limited quantity of steel can be made or that inferior iron must be used, with the consequent depreciation in the quality of the steel. The removal of the greatest enemy to the steel manufacturer—phosphorus—has been completely effected by what is known as the "basic" process, which is essentially the same as the above, only that the converter is lined with a "basic" material (in contradistinction to the "acid" or silicious lining employed in this) which combines with the phosphoric acid to form a slag, which is easily removed from the surface of the molten metal; but this process does not remove the sulphur or silicon, and iron free from these has to be used in the first instance, the effect of them, as is that of phosphorus, being to prevent the steel from rolling in a sound condition, and to make it quite unreliable. In the Siemens-Martin, or open-hearth process, the pig-iron is melted in a hollow hearth, and wrought-iron scrap is added in sufficient quantity to produce a steel containing the requisite amount of carbon, which is determined by taking samples from time to time and testing. This method was rendered practicable by the use of the Siemens regenerative furnace, by which a sufficiently high temperature can be maintained to keep the metal fluid. It will be seen that by this method also none of the injurious elements contained in the pig-iron are removed, although the percentage they bear to the metal is reduced in proportion to the amount and purity of the wrought-iron added. The "basic" system is also applied to this method of producing steel and is adapted in this case by forming the hearth upon which the charge

is melted of some "basic" substance, which combines with the phosphorus in precisely the same manner as in the Bessemer process. A method of combining the Bessemer and open-hearth processes is practised in some places, and the steel so produced is said to be of excellent quality and equal to crucible steel for most purposes. When the melted metal is brought to the right grade, it is tapped into a ladle, and then poured into the ingot moulds, which are made broader at the bottom than at the top for ease in removing; when it has solidified the moulds are taken away, the ingots brought to a full red heat and then taken to the rolls and rolled into shape in the same manner as wrought-iron. Having thus briefly glanced at some of the principal methods of manufacturing iron and steel, we will now turn our attention for a short time to the consideration of their adaptation to the various uses for which they are suited, and are coming into use more and more in buildings and structures of all kinds. Up to the present time the so-called mild steel, such as we find in rolled joists, channel-irons, &c., has proved to be unreliable when strained beyond the safe limits of wrought-iron, and there appears to be some change, either made at the time or going on subsequently to its manufacture, in its molecular structure, which causes a state of undue tension in the particles; and instances have been known where pieces of steel which have been lying untouched for years have suddenly split without any apparent cause whatever. Beginning now with cast-iron we have already seen that this crystallises in the cubic system, and this crystallisation has a very great influence in determining the strength of any section of metal; and to show this more plainly I cannot do better than quote from Messrs. Bloxham and Huntingdon's book on metals, p. 155. "When any substance crystallises, the crystallisation always takes place at right angles to the surface at which cooling or heating takes place. In other words the crystals will be formed so that their principle axes will be at right angles to the surfaces bounding the mass. The form in which iron tends to crystallise is a regular octahedron, a figure which may be represented by two square pyramids placed base to base. The importance of this may best be shown by a few examples. If a square bar be cast and cooled uniformly in all directions there will of necessity be regions in which the crystallisation proceeding uniformly from all sides will meet; along these planes of intersection there will be a confused crystallisation, and lines of weakness in the casting will result. Now let us observe what takes place in a round cast bar in which the lines of weakness are reduced to a mini-

mum. It is possible then by care in design to avoid many evils which might otherwise occur through ignorance of the laws of crystallisation. Fig. 5 represents the section of a part of the lower portion of the first hydraulic cylinder made for raising the tubes of the Britannia bridge. It broke under the great pressure to which it was exposed, the sides giving way along the planes of confused crystallisation. A new cylinder was then made, the section being altered to that shown in fig. 6. This answered perfectly, though the same kind of metal was used and no increase of mass was made. Cast-iron has an average tensile strength of about 8 tons to the square inch, and will stretch about one-eighth of an inch in 58 feet for every ton per square inch of tensile strain to which it is subjected, until its elastic limit is reached, which is at about 4 tons per square inch. It has a compressive strength of from 38 to 56 tons per square inch, the elastic limit being reached at about 15 tons, and a resistance to cross-breaking equal to 2,100 lbs. loaded in the centre of bar 1 inch square and 1 foot long between its supports." For the benefit of the younger members present it will perhaps be as well to state here what is meant by the term "elastic limit." In materials which undergo a perceptible stretch (either elongation or shortening) before finally giving way, it has been found by experiment that this stretch is, up to a certain point, directly as to the load applied, after which it increases in a greater ratio until the rupture takes place. This point, which is found by direct experiment, and requires the greatest skill and the most refined instruments to determine, is known as the "limit of elasticity" or "elastic limit." It will be seen that the compression strength of cast-iron exceeds its tensile strength in the ratio of about 6 to 1. Mr. Hodgkinson recognised this in designing the beam which goes by his name, in which the area of the bottom flange is six and a half times that of the top. Theoretically this is correct, and to a great extent in practice also, although not to the extent that one might expect. As was noticed in the first part of this paper, the centre part of a casting does not possess the same strength as the outer part, the crystals being coarser and larger, and this strength therefore must diminish in proportion as the section of the iron is thicker; heavy castings are also likely to flow in cooling, and for this reason where they have any strain to take they should always be tested before being used. Much uncertainty exists as to the best form to be used where cross strains are to be taken, and steel is now taking its place almost entirely where this is the case; but where a direct compressive strain is to

be provided for cast-iron may be used with advantage, as in columns, cradles, &c., for, especially in this colony, it can be cast to the desired shape at a very much less expense than steel could be obtained. The main points to attend to in designing a casting (and this applies to steel castings also) are:—(1) To avoid any sudden changes of shape or sharp angles which may produce lines of weakness in the crystallisation. (2) To keep as far as possible all the parts of the same thickness. (3) To so arrange the parts that the contraction consequent on cooling may not bring undue strain upon any one member more than another. Casting under pressure (one or two of the methods of doing which will be described in treating of steel) tends to produce a closer and more homogeneous metal and to increase its strength, and for this reason columns which have to take a great strain are cast on end and with a long head into which the lighter refuse matter rises, leaving the casting clean and sound beneath.

Turning now to wrought-iron, we find that as compared to cast-iron its tensile strength is considerably greater and its compressive strength less. In practice it is usual to assume its safe working strain at 5 tons for tension and 4 tons for compression. We have seen how the structure of wrought-iron changes from crystalline into fibrous during the rolling out of the "bloom" into bars, &c., and when we consider this alteration we can better understand why rolling the metal into bars should increase its tensile strength considerably. A very important peculiarity to bear in mind when using iron or steel in which the structure has been so changed is that if over-strained, over-heated, or subjected to frequent suddenly applied loads up to or beyond its elastic limit, this structure changes again and becomes crystalline, losing in strength, and ultimately causing rupture under a very much less strain than that which would have been perfectly safe in the first place, so that a structure, although over-strained, may stand for a considerable time, and at the last give way suddenly. Wrought-iron represents the metal in its purest form as a commercial product, the amount of foreign substances contained in it having been reduced to a minimum in the refining and puddling processes, and the quality of the iron depends upon the care bestowed upon it while undergoing these and the subsequent rolling processes. A good sample should, when fractured, show a fine fibrous structure of a grey colour, and should be easily malleable without showing any signs of splitting or cracking. Its use is almost universal, and, so far, it is the safest and most reliable of any material at our com-

mand for structural purposes. Steel, we have already seen, differs from wrought-iron only in its having a certain amount of carbon combined with the metal, from our approximate definition between the limits of 0.2 and 1.75 per cent. The addition of carbon appears to increase the tensile strength of the metal up to 1.5 per cent., and then gradually to diminish it until it merges into cast-iron. But although it increases the ultimate strength at which it would give way under a gradually-applied load, it renders it more liable to rupture under one suddenly applied, because the metal containing the lesser amount of carbon would stretch more, and by its stretching would gradually break the force of the sudden application, on the same principle as a spring. The average ultimate tensile strength of steel is about twice that of wrought-iron where the load is gradually applied; where suddenly applied, the results of experiments have been so contradictory that the matter is still left in a state of uncertainty. The causes of this uncertainty are:—(1) The effect produced by the small amounts of silicon, sulphur and phosphorus present in the metal, which effect is very much affected by the amount of carbon present, and the precise nature of which is not yet understood. This, as has already been pointed out, depends upon the purity of the pig-iron used in the first place, and if we could begin with perfectly pure iron we would get a perfect steel in chemical composition. But there is another cause also which makes it unreliable. The metal, when taken from the Bessemer converters or from the open-hearth furnaces, is cast into ingots, and it is often difficult to obtain sound ingots, the upper part being spongy from included hollow spaces, and sometimes honeycombed by these spaces arranged in lines perpendicular to the surface of the mould. This is attributed to the escape of gases absorbed during the process of manufacture, and thought to be nitrogen and hydrogen, although this has not been established by experiment, but it has been proved that iron and steel when solidified retain a considerable quantity of these gases, together with a little carbonic oxide. But whatever the cause, the fact remains that the upper part of the ingot is more or less porous, and the structure is not homogeneous when the ingot is rolled out, which is done in the direction of its length; one end of the bar or rail, or whatever it is rolled into, consists of this inferior part, and the other end of the sound lower part. In some places the length of rail section rolled from a single ingot is 120 feet, and it may be that when cut into lengths one length may be sound metal at

one end, and that which has been weakened by the honeycombing at the other. It has been sought to overcome this by applying pressure directly the ingot is cast. In Whitworth's method a ram connected to a hydraulic press is made to fit into the mould, and directly the metal has been run in it is brought down upon it with a pressure equal to several tons per square inch. Another method is to supply the ingot mould with a steam-tight cap, and by means of a flexible tube to introduce steam at a high pressure on top of the metal. These methods appear to prevent the escape of gas, but do not increase the density of the metal to any great degree, and the gas must remain in the ingot, though more uniformly distributed through it. Another method, and one which seems to be successful, although practised only to a limited extent, is to thoroughly stir the molten metal before pouring it into the moulds; large quantities of the secluded gases are expelled, and the metal becomes tranquil, and solidifies into sound ingots. From the foregoing it will be seen that, although steel is the stronger and tougher metal, and especially when rolled into plates or bars of small cross section is generally superior to iron, yet in the present state of our knowledge it will generally be found more advantageous to use iron where we have to depend upon the tensile strength, for the strength of a chain being its weakest link, so the strength of steel must be calculated from the worst results of the tests, unless there be some manifest outside reason for its giving a low result. Experience seems to show that it is only in thick sections that this unreliability exists when a fair margin is allowed for safety, but a great deal more has to be found out in regard to this form of the metal before we can depend upon it in the same way that we can depend upon iron. I have very little doubt that some day steel will take the place of iron entirely, but at present, although enormous quantities are made yearly, the output of wrought-iron does not diminish. I had intended to go to some extent into the nature of the stresses thrown upon the materials in constructing buildings of iron, so as to form an opinion as to the best class of metal to use in various positions; but I find that I have already reached the limit of a single paper, and so must be content to leave it out, especially as to the more artistic minds the subject as treated this evening must be a somewhat dry one. I have brought a few specimens of iron and steel freshly fractured, which I hope will assist in the understanding of my remarks, and I trust that the subject of stresses in iron structures may be taken up by someone more able than myself to do justice to it.

ABSORPTION OF VIBRATION BY ASPHALTE.

THE following extract from Mr. Delano's treatise on asphalte, which we noticed last week, will probably be of interest to our readers:—

One of the most interesting applications of asphalte is that of bituminous or asphaltic concrete for quick-speeded machinery, such as dynamos and their motors, grinding machinery like Carr's disintegrator (700 revolutions per minute) hydro-extractors (1,400 revolutions per minute), printing-machines and percussive machines like gas-engines, stamping-presses, steam-hammers, spring-hammers, &c.

The author has during the last twenty years arrested many a lawsuit begun by indignant neighbours against users of machinery in the crowded houses of cities. A high-speed engine working in a cellar will make a seven-storey house tremble, and at night prevent sleep of the inmates.

The asphalte concrete may be run in moulds to any shape and sold by the cube.

The cube is complete when the mass is big enough. For instance, take the foundations for a stamping-press; the gradual annihilation of the concussion can be felt by placing the hand on the side of the block of bituminous concrete which receives it. The latest application of asphalte concrete for this purpose is that of the electric-light motors at Moët & Chandon's, Epernay, France, where it was absolutely necessary to prevent the 8,000,000 bottles of champagne in the cellars from shaking.

The foundations for the dynamos and their motors in most of the Paris theatres are of bituminous concrete. They are surrounded by brick walls. No vibration is felt; the temperature in the cellars where the engines are is 120 deg. Fahr.

For steam-engines the surface of the foundation must be laid in cement, or have a layer of stone, to avoid bad effects of oil and grease, which are prejudicial to asphalte after a certain time. This application of asphalte requires extra care, and must not be attempted except by professional asphalters, as a failure would be no trifling matter. Only the best materials must be used. A block may take three days or more to settle and cool.

The same effect can be obtained by successive layers of hot asphalte powder compressed in a strong steel frame, and this plan is used for steam-hammers, avoiding the jarring of walls and the breaking of glass in skylights, &c.

M. Malo was the first to use asphalte to avoid the vibration of machinery, and has carried out at Pyrimont Works, the

centre of the Seyssel Asphalte Concession, many ingenious applications. The author has followed his lead in Paris. The instances are now too numerous to detail; they vary from stamping-presses and printing-machines to the heaviest engines.

At the present time (1893) an underground railway is being constructed near the astronomical observatory of Paris. The astronomers find that their mercury-bath and various delicate instruments vibrate. Both M. Malo and the author are being consulted as to the remedy, which will have to be paid for by the railway company.

Either the instruments will have to be mounted on bituminous concrete foundations or else the whole building of the observatory be insulated by a wall of bituminous concrete at considerable expense.

PATENTS.

[This List of Patents is compiled specially for this Journal by Mr. G. H. Rayner, of the firm of Rayner & Co., Consulting Patent Agents, 37 Chancery Lane, London, W.C., from whom all particulars and information relating to Patents may be had gratuitously.]

APPLICATIONS FOR PATENTS.

10861. James Kershaw and Wilhelm Gerlach, for "Improvements in water gauges."

10886. Edward Schery, for "Improvements in devices for suspending articles."

10913. Frank Ashwell and David Mein Nesbit, for "Improvements in heating and ventilating systems."

10935. Will Whalley Cottam, for "Improved fire-grate (movable) for cooking-stoves and ranges."

10943. William Melaig, for "An improvement in chimney cans or cowls."

10949. William Henry Holt, for "Improvements in, or relating to, chimney-pots, cowls, ventilators and the like."

11001. John Henry Harradine, for "An improved Dutch tong and draw vice."

11042. George Henry Webber, for "Improvements in means for attaching door handles and the like to spindles."

11057. George Tangye, for "Improvements in screw-lifting jacks."

11090. John Poate, for "A device for preventing draughts under doors."

WITHOUT KITCHEN FIRE,

HOT WATER INSTANTLY, NIGHT OR DAY.

Boiling Water in a Minute. Warm Bath when Wanted.

COMPETITIONS OPEN.

MANCHESTER.—Aug. 12.—Designs are invited for Board School. Mr. W. E. Rowcliffe, 30 Cross Street, Manchester.

MONMOUTH.—Aug. 1.—Premiums of 30 and 20 guineas are offered for schemes for Disposal of Sewage. Mr. T. R. Oakley, Town Clerk, Monmouth.

ST. HELENS.—July 24.—Designs are invited for Public Library and Technical School. Premiums of 100l., 50l. and 25l. W. J. Jeeves, Town Hall, St. Helens.

TOTTENHAM.—Aug. 1.—Designs are invited for Town Hall and Board Offices. Premiums of 75l., 50l. and 25l. Mr. J. E. Worth, 712 High Road, Tottenham, N.

CONTRACTS OPEN.

ABERDEEN.—July 10.—For Alterations to Leylodge Public School. Messrs. Ellis & Wilson, Architects, 181A Union Street, Aberdeen.

ABERTILLERY.—For Additions to Premises, Blaenen Gwent. Messrs. Alfred Swash & John Bain, Architects, 3 Friars Chambers, Newport, Mon.

ABINGDON.—July 8.—For Supplying and Fixing Two Cornish Boilers, Steam Radiators, Cooking Apparatus, &c. Mr. G. Winship, Borough Buildings, Abingdon.

ASHFORD.—June 30.—For Painting at District School. Mr. C. D. Hume, District School, Ashford, Middlesex.

AYLESBURY.—July 3.—For Building Three Cottages. Mr. W. F. Taylor, Architect, Aylesbury.

AYLESBURY.—July 4.—For Building Brick and Iron Bridge over Canal. Mr. R. J. Thomas, Exchange Buildings, Aylesbury.

BALBRIGGAN.—July 5.—For Building Six Labourers' Cottages and Out-offices. Mr. C. M. Tuite, C.E., Dalymount Cottage, Drogheda.

BELFAST.—July 10.—For Building Eight Houses, Mount-pottinger. Messrs. J. Fraser & Son, C.E., Belfast.

BIRMINGHAM.—July 4.—For Constructing 5,000 yards of Railway. Mr. J. Mansergh, 5 Victoria Street, Westminster.

BLACKPOOL.—July 5.—For Building Shops for the Market Committee. Mr. J. Wolstenholme, Borough Surveyor.

BRIDGEND.—June 30.—For Construction of Retort-house, Retort-arches, Chimney-stack, Coal-store, &c. Mr. J. H. Dyer, Secretary, Gas and Water Company, Bridgend.

BRIGHTON.—June 30.—For Supplying Portland Cement. Mr. Francis J. C. May, Town Hall, Brighton.

BURY.—For Extension of Chesham Leather Works. Mr. Thomas Wilde, Architect, 12 Cook Street, Bury, Lancashire.

CAPE TOWN.—July 6.—For Constructing Sewers, Building Engine and Boiler-houses, &c. Mr. Clement Dunscombe, 32 Victoria Street, Westminster, S.W.

CARDIFF.—June 30.—For Extension of University College. Mr. George E. Robinson, Architect, Cardiff.

CARLISLE.—For Building Vagrant Wards at Fusehill Workhouse. Mr. H. Higginson, Architect, Carlisle.

CARLISLE.—June 30.—For Raising Portion of River Wall. Mr. J. Hepworth, Engineer, The Gasworks, Carlisle.

CHELMSFORD.—July 4.—For Building Cart-shed at Farm, Springfield. The Borough Surveyor.

CHESTER.—July 8.—For Construction of Grand Stand at Sandbach. Mr. Thomas A. Beckett, St. Werburgh's Chambers, Chester.

CHESTER-LE-STREET.—For Building Two Houses. Mr. John Dixon, 7 Red Rose Terrace, Chester-le-Street.

CILFYNYDD.—June 30.—For Building Public Hall and Reading Rooms. Mr. A. O. Evans, Architect, Pontypridd.

CORNHILL-ON-TWEED.—For Building Parsonage at Etal. Mr. W. Hope, Architect, 6 Grey Street, Newcastle-on-Tyne.

COSHAM.—July 3.—For Building Infant School. Mr. C. M. Houghton, Architect, 52 Orchard Road, Fawcett Road, Southsea.

COVENTRY.—For Building Power Station and Car House. Mr. H. O'Neill, Coventry and District Tramways Co., Coventry.

COYDOR.—July 3.—For Restoration of Church. Messrs. Bruton & Williams, Architects, 15 Queen Street, Cardiff.

CROYDON.—July 4.—For Repairing Road. Borough Surveyor, 8 Katharine Court, Croydon.

DAGENHAM.—For Building Ten Cottages. Mr. J. Rookwood, 47 Museum Street, W.C.

VERITY BROS. CALL LANE, LEEDS.

Manufacturers of their High-Class

ROLLING BOLT, MORTICE & RIM LOCKS, NIGHT LATCHES, &c.

In our Deadweight Lock as per drawing herewith, we have so applied the different Movements that the pressure is equal in both ways of turning the knob, and we guarantee their giving entire satisfaction

We are also Manufacturers of—

The largest Varieties of Openers suitable for Skylights, Fanlights, &c., which can be fixed in any position.

Casements in Wrought Iron, Steel, and Gun Metal.

Espagnolette Bolts, Weather Bars, Sash Fasteners, Door Checks.

CATALOGUES FREE BY POST.

ECCLESFIELD.—July 1.—For Building Board Schools and Caretaker's House. Mr. G. A. Wilson, Architect, Hartshead Chambers, Sheffield.

ELLAND.—July 15.—For Rebuilding (Ironwork excepted) Bridgefield Mills. Messrs. C. & F. L. Horsfall, Architects, Lord Street Chambers, Halifax.

ESSEX.—July 1.—For Construction of Two Bridges. Mr. Percy J. Sheldon, Surveyor, Chelmsford.

FERNSDALE.—July 4.—For Building Thirteen Cottages. Mr. W. A. Lloyd, 20 Elm Street, Ferndale.

FORMBY.—July 6.—For Building Police Station. Mr. W. E. Vernon Crompton, Architect, Moot Hall Chambers, Wallgate, Wigan.

FULWOOD.—July 3.—For Building House at Wigan House Farm, for the Preston Guardians. Mr. Whitwell, Engineer, Fulwood Workhouse.

GATESHEAD.—June 30.—For Building Board Schools. Mr. S. Piper, Architect, County Chambers, Westgate Road, Newcastle-on-Tyne.

GLASGOW.—July 1.—For Supplying Cast-iron Pipes, Hydraulic Valves and Fittings, Bolts, Nuts, &c. Messrs. Ellington & Woodall, Palace Chambers, Bridge Street, Westminster.

GLOUCESTER.—July 3.—For Building Schools. Messrs. Medland & Son, Architects, 15 Clarence Street, Gloucester.

GRAVESEND.—July 1.—For Building Governor House at Gasworks. Mr. Joseph Davis, Engineer.

GRAYS.—July 4.—For Building Baptist Tabernacle. Mr. Charles Cobham, Architect, Shakespeare Villas, Grays, Essex.

GREAT YARMOUTH.—July 7.—For Building Two Houses. Mr. Charles G. Baker, Architect, Town Hall Chambers, Yarmouth.

HALIFAX.—July 1.—For Building Three Through Houses, &c. Messrs. C. F. L. Horsfall & Son, Architects, Lord Street Chambers, Halifax.

HALIFAX.—July 8.—For Alterations to Premises in Woolshops. Messrs. Jackson & Fox, Architects, 22 George Street, Halifax.

HANWELL.—July 10.—For Supplying Broken Granite. Mr. W. S. James, Local Board Offices, Hanwell.

HASTINGS.—July 3.—For Construction of Public Conveniences, Marina, St. Leonards-on-Sea, and Queen's Road, Hastings. Mr. P. H. Palmer, Borough Engineer, Town Hall, Hastings.

HESTON.—July 10.—For Supplying Broken Granite and Flints. Mr. H. R. Peake, Town Hall, Hounslow.

JARROW.—July 4.—For Repairing Boundary Walls, &c. Mr. J. H. Morton, Architect, King Street, South Shields.

JERSEY.—June 30.—For Widening North Pier of Harbour. Mr. E. Berteau, Royal Square, Jersey.

LAMBETH.—July 4.—For Painting Wharf. Mr. Henry Blake, Sewers Office, Guildhall, E.C.

LEYTONSTONE.—July 4.—For Cleaning, Decorating and Painting Schools. Mr. W. T. Howard, Guardians' Office, Bishop's Road, Bethnal Green, E.

LISBELLAW, CO. FERMANAGH.—July 14.—For Rebuilding Church Tower. Mr. Thomas Elliott, C.E., Enniskillen.

LISCARD.—July 10.—For Addition of Pavilion to Hospital. Mr. Arthur Salmon, Surveyor to the Wallasey Local Board, Public Offices, Egremont.

LONDON.—July 7.—For Cleaning and Painting Houses. Mr. J. Williams, Midland Railway Co., Derby.

LYMM.—July 11.—For Constructing Stoneware Pipe Sewers, Supplying and Fixing Gas-engine, &c.

MALLOW.—July 7.—For Sinking Well and Fixing Pump, Shinakilla Cross. Mr. Maurice Regan, Clerk, Poor Law Office, Mallow.

MANCHESTER.—July 10.—For Building Offices, &c., and Entrance Gateways at Electric Light Station. Mr. John Allison, City Surveyor.

MANCHESTER.—July 1.—For Constructing Gasholder. Mr. C. Nickson, Town Hall, Manchester.

MITCHAM.—July 4.—For Building Bath-room at Holborn Union Schools. Mr. H. Saxon Snell, Architect, 22 Southampton Buildings, W.C.

MIDLAND RAILWAY.—July 7.—For Cleaning and Painting Station Buildings, &c. Mr. J. Williams, Midland Railway Co., Derby.

NELSON.—July 5.—For Building Shed, Warehouses, &c., and Extension of Premises. Mr. T. Bell, Architect, 14 Grimshawe Street, Burnley.

OXFORD.—For Building New Block to Infirmary. Messrs. Giles, Gough & Trollope, Architects, 28 Craven Street, Charing Cross, S.W.

ROBT. ADAMS'S Patent Ventilating Apparatus for Continuous Sashes of Lantern Lights, Conservatories, &c. Number of Patent, 16,610, dated December 2, 1887.

The largest and best variety of Fanlights and Sash Openers, &c., to suit all requirements, viz., details of work and price, to work by means of the Vertical Screw Rod and Regulator, or Cord.
SPECIALTIES.—Door Springs, Fanlight Openers and Gear, Ventilators, Locks and Furniture, Builders' General Ironmongery. Iron Casements and Frames. Architectural and other Metal Work, &c., &c.

BUILDING AND BUILDERS.

PLANS have been approved for the erection of a Board School for 660 scholars at Frizinghall, Bradford, at a cost of 6,900*l*.

THE Sanitary Committee of the Halifax Corporation have arranged to purchase a site at Belle Vue, Halifax, for a new hospital, at the price of 5,000*l*.

THE committee of the Bridgnorth and South Shropshire Infirmary have decided to accept the offer of Mr. T. Martin Southwell of a plot of land situated at North Gate as a suitable site for a new infirmary, and also to issue a public appeal for subscriptions. The cost is estimated at 4,000*l*.

At the meeting of the Baths and Washhouses Committee of the Leeds Corporation, a selection was made of plans which

it was decided to recommend the Council at its next meeting to adopt for the building of public baths in Kirkstall Road and Union Street. A sub-committee had reduced the plans sent in to three sets.

At a public meeting of persons interested in the Midland Counties Idiot Asylum, Knowle, just held, it was resolved that an appeal should be made for a sum of about 1,200*l*., which is required for the construction of an infectious ward.

THE additions and alterations to the headquarters of the 1st W. Y. V. Royal Artillery, Leeds, were completed last week. The work has been carried out by Mr. William Bakewell, F.R.I.B.A.

At the meeting of the Edinburgh Dean of Guild Court fifteen out of thirty-three applications were granted. Of these one was a warrant to the Governors of George Heriot's Trust for the erection of a large detached hall, on the west side of the hospital, to seat about 1,400 boys.

ACCORDING to the *Engineering News* of New York, over 500 architects have applied for copies of instructions for the New York City Hall competition.

TRADE NOTES.

THE typewriter, we hear, has apparently demonstrated its utility to the Vatican, for the Priory Chamberlain to His Holiness the Pope has just adopted the Yost machine. Announcements are continually being made pointing very conclusively to the almost universal adoption of the typewriter, though for many years the promoters of the writing machine had to complain bitterly of the unreasonable, conservative prejudice of the public.

THE clock on the tower of St. Mark's Church, Wolverhampton, has just had new illuminated dials fitted. They are each 6 feet diameter, and glazed with white opal glass. Automatic clockwork apparatus has been attached to turn the gas up and down for the varying lengths of the days throughout the year. The work has been carried out for the Wolverhampton Corporation by John Smith & Sons, Midland Clock Works, Derby.

MR. JOHN FIELDING, contractor and stone merchant, Alton, Staffordshire, has acquired the Beggar's Well and Battlesteads Quarries, Alton, and invites inspection from archi-

fects and contractors. Cheadle Roman Catholic church of St. Giles was built of stone from this quarry fifty years ago, a church well worthy of a visit, and the spire has been a severe and long test of weather qualities of this stone. It was built from the designs of the late Mr. A. W. Pugin, and occupied nearly six years in erecting. It is built of Beggar's Well stone, and was opened September 1, 1846. According to a local description it is the most superb building for ecclesiastical purposes that has been erected in England for many years, and cost the founder 80,000/. The style is that which prevailed during the reign of the Edwards, commonly called Decorated; and no labour or expense was spared in ornamenting both the exterior and the interior with richly sculptured devices, statues, &c.

THE new infectious hospital, Chertsey, is being warmed and ventilated by means of Shorland's patent open fireplace Manchester stoves, with descending smoke flues, the same being supplied by Mr. E. H. Shorland, of Manchester.

THE Parks Committee of the Edinburgh Town Council have recommended the acceptance of a tender amounting to nearly £700 for the formation of the "ride" in Inverleith Park.

THE Thetford Town Council received one tender only for proposed alterations to the shambles and improvements to the outbuildings of the Red Lion Inn at a cost of 451/, from Mr. Broughton. A motion not to accept the tender was defeated and the amendment to accept the tender carried.

MESSRS. THOMAS CRAPPER & CO. write to us:—"We have the pleasure to inform you that in honour of the forthcoming Royal wedding we purpose closing our works on July 6, upon which occasion the whole of our workmen and staff will be given a holiday.

VARIETIES.

THE annual conversazione of the Institute of Electrical Engineers was held on Friday evening, the 23rd inst., in the galleries of the Society of Painters in Water-Colours in Princes' Hall, Piccadilly. The company were received by the president, Mr. W. H. Preece, and Miss Preece. The attendance was very large and the rooms were densely crowded. An excellent programme of music was performed by the band of the Royal Horse Guards (Blues), under their conductor, Mr. Charles Godfrey.

THE *Engineering Record*, New York, says:—It is reported that the State of New York is soon to make experiments on electric towing of canal boats on the Erie Canal. It is well known that Governor Flower has for some time been very confident that such a system of propelling can be successfully applied. So far as estimates have been prepared, it would appear that the expectation is to propel a boat by electricity at a cost of 50 to 60 cents a day, but the actual cost can better be computed after an appreciable amount of experience than at the present time.

AFTER the rejection by the Bristol City Council of the scheme for the construction of new docks at Avonmouth at the cost of a million sterling, several of the Docks Board have resigned, deeming it hopeless to make any further proposal for the development of the trade of the port.

THE Weaver Navigation Bill has been ordered for third reading by the House of Commons, after adoption of an amendment to enable Parliament to deal with the whole question of the constitution and management of the Trust.

ACCORDING to the *Glasgow Herald*, on Monday, the 26th inst., the building in Cathcart Street, Greenock, known as the Tontine Hotel, and recently purchased by the Post Office authorities, on the site of which to erect a new post office, was exposed to public auction by Messrs. Hutchison & Dixon, Glasgow. There was a good attendance of tradesmen and brokers. The bidding was started at 5/., and quickly rose to 125/., at which figure it was knocked down to Mr. Brown, Galloway Street, Paisley. It was reckoned by some of the builders that it would cost over 200/ to remove the material, which must be completed within four months, and that there would be 600 carts of rubbish. The original cost of the building was about 7,000/., and the purchase was made for the Government at about 6,000/.

AN inquiry has been held to consider the application of the Basford Rural Sanitary Authority for sanction to borrow 7,000/ for works of sewerage and sewage disposal for the districts of Codnor and Loscor. The estimated cost of the work is 7,000/ and the engineer is Mr. W. H. Radford, C.E., of Nottingham.

AN inquiry has been held at Lancaster into an application made by the Town Council for sanction to borrow 25,000/., the estimated cost of a system of electric-lighting installation for the borough. For the present the Corporation propose to light only the main streets in the centre of the town; but arrange-

THE Plans and Works Committee of the Edinburgh Town Council advise the erection of public baths in the north side of the city.

AN inquiry has been held by the Local Government Board in regard to an application of the Improvement Commissioners of Stourbridge for sanction to borrow 5,000*l.* for gas purposes.

A NEW feature has been added to the World's Fair at Chicago by the opening of a wheel 250 feet in diameter, swung on an axle which rests upon towers 135 feet high. Attached to it are thirty-five cars, similar to those used in elevators, each

offered to the public. The closet, named "Darrah's Artisan Wash-down Closet," is fitted with lifting seats, in walnut, mahogany, polished deal, &c. This closet is complete in itself, requires no seat brackets or other-wall fixings, and is thus cheaper, more easily connected, neater and more effective than many closets now in use. It is also open all round, and can harbour no dust or dirt. It is made in different designs, suitable for workshops, cottages or mansions, and is also especially suitable for public buildings, waiting-rooms, railway stations, &c. The closet is made in various designs in fireclay, buff and white, cane and white earthenware, white or ivory earthenware, and also in decorated patterns.

containing seats to accommodate forty persons. The wheel is moved by an engine of 1,000 horse-power, and the occupants of the car make the complete circuit.

NOTES ON NOVELTIES.

WE illustrate one of the new pattern Darrah's patent pedestal closets, which Messrs. Baxendale & Co., of Manchester and Edinburgh, have recently introduced, and for which there has been so large a demand in the short time they have been

PILE FOUNDATIONS, CHICAGO.

THE use of deep-pile foundations has been strongly advocated as advantageous in Chicago by General William Sooy Smith, M.Am.Soc.C.E., and in a recent issue of the *Technograph* he describes the work done in this direction for the foundations of the new public library building in that city. The system consists in abandoning the spread foundation of steel and concrete resting on the unstable clay which underlies most of the business parts of the city, and to employ instead a foundation of deep piles reaching down to the bed of

compact clay and gravel about 45 feet below the city datum. The reason advanced for this change by General Smith is that where independent spread foundations are used some of the largest buildings have been observed to settle irregularly after completion. The deep piling is claimed to be much more stable.

In the new public library building trenches were dug on the lines of the walls sufficiently wide to permit the necessary shoring, and to include three rows of piles driven about 3 feet between centres. The character of the upper clay stratum at this place is shown by the fact that it crowded through the smallest crack in the sheet piling almost as if it were quicksand. The depth of excavation permitted sawing and capping the piles to a point such that the highest level of timber used in the grillage is 14 feet below the city datum, which is about the level of Lake Michigan. From this grillage rubble masonry is carried up to the neat masonry courses of the basement. While the work was in progress, a test was made to determine the bearing power of four of the piles of Norway pine, after they had been driven in the trench. The driving was done with a steam hammer weighing in all 8,300 lbs., the hammer alone weighing 4,500 lbs., and delivering 54 blows per minute with a stroke of 42 inches. The last 20 feet of the driving was done by means of an oak follower. These piles were driven about 2½ feet between centres.

The bearing power of the four piles was tested by building a platform on top of them, which was loaded with pig-iron. Levels were carefully taken on each of the four. The piles stood four days with a loading of 5½ tons per pile, eight days with a loading of 37·3 tons per pile, and ten days with a load of 50·6 tons, all without a settlement exceeding 0·01 foot. In discussing these tests General Smith states that if 250 lbs. per square inch be estimated for point resistance, the average frictional resistance will be about 3·2 lbs. per square inch of side surface of pile, or about 432 lbs. per square foot. For an ordinary pile, 7 inches through at the top and 14 inches at the butt, driven 45 feet, the frictional resistance he assumes to be 59,000 lbs. and the point resistance 6,000 lbs. Hence he computes a total earth-resistance of 65,000 lbs., with a factor of safety of from 5 to 6. The resistance of the pile considered as a column he estimates at 65,000 lbs., with a factor of safety of 3 to 4.

Another noticeable building on deep piles is the new Illinois Central Railway passenger station in Chicago, a structure 180 by 220 feet in plan and consisting of an office portion

nine storeys high, a tower thirteen storeys high and a station three storeys high, with which is connected an eight-track trainshed 680 feet long. According to a paper in the same magazine, written by C. J. Mitchell, an assistant civil engineer of the railroad, borings taken on the site showed from 10 to 20 feet of rubbish which had been dumped there immediately after the great fire, below which were irregular strata of stiff blue clay and quicksand. Rock was more than 60 feet below the surface. This condition of things led to the adoption of deep-pile foundations. About 1,700 were driven in all, arranged in groups or clusters under each column. Under the head house there were eight, thirteen and sixteen piles in the groups, under the office twenty to forty-two, and under the tower one of the corner pilasters had seventy-three piles. These piles were usually arranged on the square, lining both ways, but alternating in rows 18 inches apart, so that the distance between centres was 25½ inches. This is said to be as close as they could be driven, and even when the points were spaced in this way the tops were sometimes considerably out of line after driving.

In size the piles were from 40 to 60 feet long, averaging 51 feet, and from 11 to 16 inches through at the butt end. Thirty-two per cent. were black gum, 22 per cent. pine, 7 per cent. basswood, 21 per cent. oak, 15 per cent. hickory, with a few maple and elm. A cast-iron cap was used in driving, but in spite of this 8 per cent. of the heads were crushed or split. The pine piles had the poorest driving record, the heads of 12½ per cent. being crushed and 5 per cent. broken. The gum had 7 per cent. crushed and 0·6 per cent. broken; the oak had 5 per cent. crushed and 0·8 per cent. broken; the hickory had 3 per cent. crushed and none broken, and the basswood had 8 per cent. of the heads crushed. In several of the oak piles the sap wood was separated from the heart, the corks being driven through the shells. All the piles were cut down to form a point 4 inches square.

Drop-hammer drivers were used on this work, the hammers weighing 2,800, 3,200 and 3,800 lbs. respectively. The best record, 26 piles driven home to a depth of at least 60 feet, was made by the driver having the heaviest hammer, although there is some doubt in Mr. Mitchell's mind as to whether this result was due to the greater weight of the hammer or to the greater ability of the crew in charge. The last blow was generally given with a fall of 35 to 40 feet, though when driving close to a building a fall of 50 feet was used with about the same success. The penetration at the last blow averaged about

VOLUME XLVIII. OF THE ARCHITECT.
Handsomely bound in Cloth, Gilt Lettered. Price 12s. 6d.—Office: 175 Strand, London, W.C.

3 inches, though a number went less than $1\frac{1}{2}$ inches. The cap prevented much loss by brooming. The distance to which could be traced the vibration due to the driving varied with the fall, the character of the soil, and the spacing of the piles. It was easily felt at 400 feet, while the effect at 75 feet was quite marked. It is stated, however, that in doing instrumental work the vibration was sometimes less severe within 25 feet of the driver than at several times that distance.

The piles were usually driven in groups until the tops of all were below the leads when the driving was completed by means of a follower. Water was kept running around the pile at the surface while the driving was in progress, as this seemed to be of considerable aid. After the piles had been driven the tops were sawed off to a uniform height of 3 feet below datum, in order that all the timber should be below low water. As this was from 10 to 14 feet below the surface the trenches had to be sheathed and kept drained by continual pumping. After the piles were cut off and the earth excavated 18 inches below their tops, rich Portland cement concrete was tamped in even with the tops. Oak caps 12 inches square were then drift-bolted to the centre of each pile, and the space between the timbers filled with concrete. It is believed that this piling will last many years, as pile trestles built twenty-one years ago on the same railway are stated to be perfectly sound now wherever they were below the permanent water level.

A rather interesting set of observations on the effect of pile-driving on adjacent objects is described by Mr. Mitchell. In one instance a group of sixteen piles was driven about 15 feet from a group of eight which had been sawed off to a uniform height and had waling pieces drifted on. These waling pieces were raised 4 inches on the side next the driver and 1 inch on the opposite side. Under similar conditions, when sixteen piles were driven about 15 feet from a finished pier consisting of eight 47-foot piles, $2\frac{1}{2}$ feet of grillage and concrete, and 12 feet of stone masonry, the pier rose $\frac{3}{4}$ inch on the side next the driver, but on the further side it remained at the original elevation. Two weeks later this pier was again tested, and the high side was found only $\frac{1}{4}$ inch too high, while the other side had not changed. Again, in a group of seventy-two piles a spike was placed in the head of the first pile driven, and elevations were taken daily. The first two days the pile sank $\frac{1}{2}$ inch, then rose steadily until fifty piles had been driven, when it was 3 inches above the first height, the greatest rise in one day being $\frac{3}{4}$ inch. This pile was 55 feet long, of which 45 feet was in the ground.

NEW CATALOGUES.

WE have received a copy of a new illustrated price list of Whitfield's safes from Messrs. F. Whitfield & Co. of Birmingham, who are sole manufacturers of the patent Sicker safes. The manufacture of safes has been brought to a perfection far beyond what could have been expected, being proof against the terrible onslaughts of fire and the attacks of the cleverest burglars. It would be difficult to produce testimonials to bear witness in regard of safes that have withstood tampering by thieves, burglars, &c., these undesirable persons never now wasting their time over impossibilities. Fires, however, whatever precautions are taken, will and do break out, and however lamentable the destruction of property caused by them, the safes are eventually found to have preserved their contents uninjured however great the fiery ordeal they have been subjected to. Valuables can be insured, but documents and books have a value that no insurance can cover, and many business persons can testify their obligations for the preservation of the documents, papers, &c. which, though of no use to any but the owner, are invaluable to him. Messrs. Whitfield & Co. can show practical evidence of this in the testimonials sent to them by their customers who have lost by fire everything but the contents guarded in the safes. The list illustrates safes ranging from smaller articles such as fire-resisting deed-boxes to the most safe-proof appliance for use of bankers, jewellers, &c. fire and thief-resisting doors, grilles, &c. included. We have so often described the variety of safes and their specialties of character and merit that we need only refer our readers to the catalogue to choose for

themselves what will suit their particular purpose. The prize medals Messrs. Whitfield & Co. have taken and the approbation afforded them by their clients are a warrant for their selecting as motto "Fast Bind, Fast Find."

A NEW illustrated list of Mason's patent "unwearable" non-slipping stair-treads, hydrant and manhole covers, coal-plates, &c., has been issued, as manufactured by the Safety Tread Syndicate, Limited, of 15 Barbican, E.C. The treads, being a combination of chilled steel, iron or other hardened metal with lead, will be found to be as designated, "unwearable." The two metals are so arranged that the one withstands the wear while the softer one gives the foothold. Worn stone steps also are repaired by this system cheaper than with stone. The coal-plates are made on the same principle as the stair-treads; accidents from slipping on them are impossible. They are supplied either ventilated, illuminated or solid, and are guaranteed to last longer than any other, and to be the only perfect non-slipping coal-plates in the market.

GLASGOW ART GALLERIES.

APPLICATION was made in the Glasgow Dean of Guild Court by the Association for the Promotion of Art and Music in the City for permission to erect new art galleries in Kelvingrove Park. The applicants had the consent of the Lord Provost, magistrates and Town Council. Mr. A. F. Baird, who appeared for the association, explained that on the termination of the Glasgow International Exhibition of 1888 there was a surplus of 46,000*l.*, and the association, which was now before the court, was formed for the purpose of applying that surplus in the erection of public art galleries, a concert-hall and museum. By arrangement with the Corporation, it was agreed that the latter should grant a site for the buildings in Kelvingrove Park, on condition that a sum at least equal to the surplus was raised by subscription, and also that the plans of the buildings should be approved by the Town Council. The association had now collected the sum of 65,000*l.* by subscription, and the plans had received the approval of the Town Council and the city engineer, so that both conditions had been fulfilled. The present application was for authority to erect the basement floor of the proposed buildings, which was all it was intended to do meantime. The application was granted. Messrs. Simpson & Milner Allen, London, are the architects.

SMOKE PREVENTION.*

WHEN fresh coal is thrown on a bed of incandescent coal, or is otherwise highly heated, there immediately begins the distillation of the more volatile portions of the hydrocarbons in the coal, which distilled matter is burned if the temperature is high enough and a sufficient supply of oxygen is present, but which pass up the chimney as yellowish fumes if either of these two essential conditions of combustion are wanting. As the fresh coal becomes more highly heated the less volatile hydrocarbons are distilled, and these being, chemically speaking, unstable compounds, are decomposed or disassociated by the heat at a temperature much below that at which the carbon thus liberated combines with oxygen in combustion. The temperature necessary for combustion of this free carbon is very high; approximately 2,000 deg. F., and hence there is a wide margin of opportunity for this portion of the carbon to escape unburned, as this temperature is somewhat difficult to maintain in the mass of gaseous matter above the coal.

It is this free, unburned carbon, in a finely divided, incandescent state which produces the bright, luminous flame, and which, when cooled, produces the black clouds of smoke that issue from the chimney and which afterward settle as soot. After the volatile matter is all driven off, there still remains the fixed carbon, which now is in the form of coke. This gives but little flame and no smoke in burning, as the particles of carbon are not detached from the solid mass till combustion takes place.

The causes of smoke may, from the foregoing description, be stated to be either:—(1) An insufficient amount of oxygen for the perfect combustion of these combustibles; or (2) an imperfect mixture or distribution of the oxygen with the combustibles, even though present in sufficient quantity; or (3) a temperature too low to ignite the distilled volatile matter and the separated free carbon when properly mixed with the air.

The loss of fuel in the smoke itself is not very serious, as a very dense black smoke represents but a small lot of carbon. The British Smoke Abatement Committee in 1882 estimated the fuel lost in the densest smoke to be less than 1 per cent. of the coal producing it. In our own country Mr. J. C. Hoad-

ley by experimentally passing very dense black smoke from bituminous coal through water and collecting the solid carbon, found that it only amounted to about one-sixth of 1 per cent. of the coal burned. The most serious losses are due to the escape of some of the light hydrocarbons and carbonic oxide—both invisible gases—the former of which has a calorific power nearly double that of pure carbon, and the latter about one-third that of pure carbon. While therefore the losses of fuel are not confined to the smoke itself, still the total losses may be assumed as generally being indicated by the amount of smoke produced, since the conditions that are unfavourable to the combustion of the free carbon, which appears as smoke, are also unfavourable to the combustion of the other combustible gases which tend to escape.

Touching the hygienic effects of smoke, Dr. W. A. Daley, a prominent physician of Pittsburg, stated before the Engineers' Society of Western Pennsylvania, in March 1892, that every medical man in Pittsburg who had made post-mortem examinations recognised the effect of smoke in the darkly-mottled lung-tissue filled with carbonaceous matter, and distinctly stated that this deposit induces consumption of an incurable character. He said that the death-rate in that city during the eight years of freedom from smoke was 1.62 per 1,000 lower than for the preceding eight years of smoke, and that since the partial return of the smoke the death-rate has again risen from 19.58 per 1,000 to 22.15 per 1,000, showing an increase of 2.57 per 1,000, notwithstanding the fact the period of low death-rate included the fatal epidemic of "la grippe" in that city. The increase in Pittsburg's death-rate placed it above those of St. Louis, Chicago, Buffalo, Detroit, Milwaukee, Louisville, Indianapolis and other cities whose hygienic conditions are otherwise not superior to those of Pittsburg. It is well known that carbon, either in the porous form of charcoal, or in the finely divided form as soot, has a very great capacity for the absorption of gases. It is equally well established that floating particles in the atmosphere draw to them the minute spores, organisms and impurities that are ever present in the air about a large city. It is not difficult to imagine, therefore, that the soot that inhabitants of a smoky atmosphere inhale with every breath, but do not exhale, may be the carrier of both noxious gases and organic impurities.

But the sanitary objection to smoke is not the only one. It is objectionable from the disagreeable defacement of public buildings and residences, by the insidious soot which pervades our dwellings, offices, libraries, picture galleries and stores,

injuring our clothing, pictures, books, papers, furniture and *bric-à-brac*. It is objectionable from the fruitless efforts for cleanliness where cleanliness is impossible. It is objectionable from the loss of light and the increased cost of artificial light. It is objectionable from the repression of æsthetic tendencies and the mental and moral depression and discouragement. It is objectionable in its effects on our citizens, many of the more wealthy and cultivated of whom will not remain in an atmosphere of smoke.

The Smoke Remedy.—In the ordinary boiler furnace as generally constructed and fired, the conditions are very unfavourable for perfect combustion during the period in which the volatile matter is being driven off from each charge of coal. When the fixed carbon stage is reached there is but little difficulty in maintaining perfect combustion, but when a fresh charge of coal is added the difficulties appear; the air supply, if not in excess during the burning of the previous incandescent coal, will now be in deficit, since the distillation of the volatile matter calls for an increased amount of air, while in fact the greater depth of coal now on the grate actually reduces the supply. If an additional supply is admitted through the furnace doors it will be cold and cannot be thoroughly mixed with the combustible gases. So with the temperature; if high enough before charging it is now much lower, owing to the cooling effects of the cold air rushing in when the doors are opened, of the mass of cold coal, of the evaporation of the moisture in the coal and of the distillation of the volatile matter, so that by the time a high temperature is needed to burn the free carbon the furnace is at its coldest.

In fulfilling the requirements of sufficiency of supply and thoroughness of mixing the air with the combustible gases, it must be noted that these conditions should not be secured by a reckless surplus of air, as this carries away useful heat, which is not only a loss in itself, but may, and often does, result in lowering the temperature of the combustible gases below their temperature of ignition, thus causing the escape of unburned fuel. Owing to the difficulty of effecting such a thorough mixture as to bring to each combustible particle just its proper amount of air, it is necessary to provide a surplus of air, but this should be considered as an evil to be kept at a minimum by the most thorough mixing possible. Each pound of carbon requires for perfect combustion about 12 lbs. of air, and each per cent. of excess over this amount has the effect to not only reduce the total available heat by about one-eighth of 1 per cent., but reduces the temperature of combustion by about one-

half of 1 per cent., with the unknown resulting loss of unburned escaped fuel mentioned above.

A very large proportion, probably over 90 per cent., of all the smoke produced comes from steam-boiler furnaces (including those of locomotives and steamboats) and from domestic fires. As to the relative proportion of the two classes, it is doubtful if the former produces as much smoke as the latter in the aggregate; but, coming from forces less scattered and being concentrated in dense black clouds, the smoke from boilers is more noticeable, deposits a larger proportion of soot, and can be more readily reached and more effectively remedied than that from domestic fires. As the combustion in these two cases takes place under radically different surroundings, it will be necessary to treat the subject of smoke-prevention in these two cases under different heads.

Passing to the means of accomplishing combustion without smoke production, it is safe to say that, so far as pertains to steam boilers, the object must be attained by one or more of the following agencies:—

1. By the proper design and setting of the boiler plant. This implies proper grate area, sufficient draught, the necessary air admission space between grate bars and through furnace, and ample combustion room under boilers.
2. By that system of firing that is best adapted to each particular furnace to secure the perfect combustion of bituminous coal. This may be either (a) "coke firing" or charging all coal into the front of the furnace until partially coked, then pushing back and spreading, or (b) "alternate side firing," or (c) "spreading," by which the coal is spread over the whole grate area in thin, uniform layers at each charging.
3. The admission of air through the furnace door, bridge wall or side walls.
4. Steam jets and other artificial means for thoroughly mixing the air and combustible gases.
5. Preventing the cooling of the furnace and boilers by the inrush of cold air when the furnace doors are opened for charging coal and handling the fire.
6. Establishing a gradation of the several steps of combustion so that the coal may be charged dried and warmed at the coolest part of the furnace, and then moved by successive steps to the hottest place, where the final combustion of the coked coal is completed, and compelling the distilled combustible gases to pass through this hottest part of the fire.
7. Preventing the cooling by radiation of the unburned com-

bustible gases until perfect mixing and combustion have been accomplished.

8. Varying the supply of air to suit the periodic variation in demand.

9. The substitution of a continuous uniform feeding of coal instead of intermittent charging.

10. Down-draught burning or causing the air to enter above the grate and pass down through the coal, carrying the distilled products down to the high temperature plane at the bottom of the fire.

The number of smoke prevention devices which have been invented is legion. The scope of the present paper renders anything more than a brief classification of their principles of working impossible. These are:—

(a) Mechanical stokers, which automatically deliver the fuel in a crushed or finely divided state into the furnace at a uniform rate, and also keep the fire clean by a slow but constant motion of the individual sections of the grate. They accomplish their object by means of agencies 5, 6 and 9 of the foregoing list. They effect a very material saving in the labour of firing and are efficient smoke preventers when not pushed above their capacity, and when the coal does not cake badly. They are rarely susceptible to the sudden changes in the rate of firing frequently demanded in service.

(b) Air flues in side walls, bridge wall and grate bars through which air when passing is heated. (Agency 3.) The results are always beneficial, but the flues are difficult to keep clean and in order.

(c) Coking arches, or spaces in front of the furnace arched over, in which the fresh coal is coked, both to prevent cooling of the distilled gases and to force them to pass through the hottest part of the furnace just beyond the arch. The results are good for normal conditions, but ineffective when the fires are forced. The arches also are easily burned out and injured by working the fire.

(d) Dead-plates, or a portion of the grate next the furnace doors, reserved for warming and coking the coal before it is spread over the grate. These give good results when the furnace is not forced above its normal capacity. This embodies the method of "coke-firing" mentioned before.

(e) Down-draught furnaces, or furnaces in which the air is supplied to the coal above the grate and the products of combustion are taken away from beneath the grate, thus causing a downward draught through the coal, carrying the distilled gases down to the highly-heated incandescent coal at the bottom of

the layer of coal on the grate. In this furnace the grate-bars must be kept cool by the circulation of water through them, as they have to bear the hottest portion of the flame. This is the most perfect manner of producing combustion, and is absolutely smokeless.

(f) Steam jets to draw air in or inject air into the furnace above the grate and also to mix the air and the combustible gases together. A very efficient smoke preventer, but one liable to be wasteful of fuel by inducing too rapid a draught.

(g) Baffle plates placed in the furnace above the fire to aid in mixing the combustible gases with the air.

(h) Double furnaces, of which there are two entirely different styles, the first of which places the second grate below the first grate; the coal is coked on the first grate, during which process the distilled gases are made to pass over the second grate, where they are ignited and burned; the coke from the first grate is dropped on to the second grate. A very efficient and economical smoke preventer, but rather complicated to construct and maintain. In the second form, the products of combustion from the first furnace pass through the grate and fire of the second, each furnace being charged with fresh fuel when needed, the latter generally with a smokeless coal or coke. An irrational and unpromising method.

Passing to the prevention of smoke from domestic fires, the fortunate circumstance is presented that the evil is decreasing, due (1) to the growing tendency to heat all public buildings and large residences by either steam, hot water or hot air, using furnaces either of improved form or such as can be made smokeless by some of the foregoing agencies; (2) to the increasing use of base burners and improved forms of fire-grates, the former of which are practically smokeless and the latter partially so. It will be proper to bring pressure to bear to suppress the smoke from domestic fires, when the more serious and more easily remedied boiler smoke has been abated.

Smoke prevention must be accomplished from the side of the public by educating the people to consider smoke as a nuisance that unquestionably can and should be abated. It is idle to attempt the prevention of smoke by appealing to the interests of the smoke producers, as it is always difficult to prove to their satisfaction the extent to which it is to their interest to prevent its production, and when so proven they are not always willing to give the increased attention and immediate expense to secure the small, continual, prospective savings in fuel. In many cases boilers are being forced much above their maximum proper capacity; in such cases smoking is almost

inevitable, and can only be stopped by reducing them to their proper capacity, which means less steam per boiler and more boilers, the supplying of which, and the alteration necessitated thereby, may cost more than the capitalised amount of the prospective annual saving in fuel. The same may be true of boilers with very defective setting or draught. In all such cases the pressure must be brought from without, and with propriety, for the fact of the increased necessary expenses gives no smoke producer the moral or legal right to pollute the atmosphere and injure the property of thousands or even of one of his neighbours.

It is no longer a problem whether smoke can be prevented or not. This has been settled conclusively in the affirmative in a number of localities where proper laws for smoke abatement have been passed and enforced.

Manchester and Birmingham, in England, and Glasgow, in Scotland, under the action of the Smoke Abatement Act, have had their atmosphere very greatly improved. A prominent citizen of Pittsburg, formerly of Birmingham, says:—"On my recent visit to Birmingham, England, I was surprised to see such a clear atmosphere and smokeless chimneys compared with the Birmingham I saw twenty-one years ago."

Another resident of Birmingham says:—"Birmingham, a manufacturing town of half a million inhabitants, and using no fuel but bituminous coal, is comparatively clean. . . . The reasons that Birmingham is comparatively clean are, doubtless, the Smoke Consuming Act and the public spirit that sees that it is enforced."

Mr. C. F. White, consulting engineer to the Chicago Society for the Prevention of Smoke, writes under date of May 4, 1893:—

"The experience had in Chicago has shown plainly that it is perfectly easy to equip steam boilers with furnaces which shall burn ordinary soft coal in such a manner that the making of smoke dense enough to obstruct the vision shall be confined to one or two intervals of perhaps a couple of minutes' duration in the ordinary day of ten hours. . . . It is safe to say that the work of the past year has resulted in diminishing the amount of smoke in and about the business centre of Chicago by 75 deg. to 80 deg. as a whole, and there are plenty of individual cases where the abatement will probably reach more than 98 deg. of the smoke made a year ago."

In Cincinnati, where—like Chicago—a law had been on the statute-books for a long time without results because not enforced, a supervising engineer has within a year been

Glasgow, 112 Saint Vincent St.; Belfast, Central Hotel Buildings.

appointed, and has made substantial progress by securing convictions under the smoke ordinance in a large majority of the suits brought. There has also been a very decided abatement of smoke in a large number of cases notified to abate, and a still larger number are making the changes necessary to accomplish smoke abatement. From his experience of the past few months, the supervising engineer expresses the belief that "within the next three months 500 chimneys will be made smokeless."

These facts establish the possibility of smoke abatement in the cities mentioned, whose conditions are not more favourable for its accomplishment than in hundreds of other cities. Although the technical possibility of smoke abatement is no longer uncertain, there still remain three important steps to be taken before its benefits may be secured by any city. These are:—

1. The education of the people to the objectionable effects of smoke, and to the possibility of its abatement.

2. The enactment of suitable laws for the accomplishment of smoke abatement.

3. The provision for systematic enforcement of the above ordinances by continual inspection and legal prosecutions, and for furnishing to smoke producers, when desired, professional advice and assistance regarding means and appliance for smoke prevention.

The best laws are fruitless without an intelligent public sentiment behind them that will not only support them, but will see that they are enforced. Smoke producers should be encouraged in their efforts to comply with the laws by having the benefit of reliable and professional advice, when desired, to aid them in selecting the most effective and economical means and appliances for smoke prevention from the endless number of good, bad and indifferent inventions that follow in the wake of all smoke reforms, and which appear to the average purchaser to be of equal merit.

AMONG the applications granted by the Glasgow Dean of Guild Court the School Board of Govan got permission to build a new school in Allison Street; Messrs. Moss, Thornton, & Kirk, to make alterations on the Scotia Theatre of Varieties; the Town Council of Glasgow, to erect tramway stables in Maryhill; the Scottish Temperance League, to take down existing buildings on the east side of Hope Street and erect new buildings.

THE ORNAMENTAL TREATMENT OF BRICKS AND IRON.*

It must be fully understood at the outset that the meaning the author intends to convey by the term design is that treatment which, whilst securing the necessary results in regard to purely constructive efficiency and convenience, will aim at a beautiful, effective and pleasing result. Of late years much has been done to improve construction by economic production of the raw material of brick and iron, and also its scientific use in working up and placing in the building; and certainly some of our buildings give astonishing results in this respect. Every attention possible has been paid to getting good results in fireproofing, stability, economy in construction, and greatest efficiency from subsequent use, but at the same time it must be admitted that the efforts to produce an effective and ornamental result have in general been weak and ineffectual. The modern building is a structure reared under widely differing conditions from that of the ancients, not only on account of the difference in domestic, political, religious and commercial circumstances, but also because of the fact that, whereas the range of choice in materials, both in kind and quality, then was extremely limited, whilst in modern times the field is much wider. All this notwithstanding, it is the habit to work the brick and iron by all possible means, and at times no little ingenuity is used in attempts at ill-advised imitations of the old work. It will surely be conceded by all that the architect or the engineer does but little justice to himself and to his work when he hides the elaborately thought-out piece of iron and steelwork, or perhaps brickwork, in a modern edifice by a clothing of trumpery deception in imitation of a Greek or Roman temple, the original of which was in marble. The Grecian development of the Orders, which are now so basely copied, commenced at the building of the wooden hut, with its ungainly trunks of trees as support, but the absurdity was not perpetrated of cutting in stone, when such came to be used, a replica of even the bark and knots that hung to the wooden supports; on the other hand, accepting the general characteristics of the wooden building as a mere foundation to work on, they rapidly improved and suited the design to the more pliable and suitable, but still very different, material, stone, and

THE SANITARY BATH CO., LIM., 12 MILLER STREET, HIGH STREET, CAMDEN TOWN, N.W.

the results they achieved are world-renowned. The glorious result would never have been had they continued to imitate only. It is in the production of a harmonious suitability of the design to the improved and modern materials and construction that the future of our buildings, as far as appearance is concerned, lies. And the architect or engineer will have to thoroughly understand the requirements of these materials when working them up to give an ornamental result. On account of brick and iron having such a great deal to do in the general formation and construction of our buildings, and moreover as there is every possibility of the use greatly increasing, some attention might with very great advantage be paid to their careful and considerate distribution and treatment.

Bricks.

Brick, unlike iron, is an old building material, evidence existing that it was used in the time of the Egyptians, though at present little other than traces of Roman work exist. The early Egyptians and Greeks used stone in all works of a prominent nature where permanence and durability were aimed at, and the bricks by them were used more generally for smaller works. The brick of to-day has, however, changed very much, both in the method of production and especially in quality, and again, we moderns find it so well suited to grapple with considerations in construction which were never thought of by the ancients; hence we may fairly consider it a modern article, if not in itself at least in the manner in which it is constructively treated. The Romans used the brick to form a body to their walls and then covered the surface with marble or other stone slabs or tiles, and here began the system which is carried to such extremes at present. Brickwork reached a very satisfactory condition in the Middle Ages, and some of the works of that period show that careful consideration was paid to the preparation of suitable designs; however, neither the treatment adopted by the Egyptians, Romans nor any of the Mediæval work is safe to imitate at the present, because naturally as time goes on, convenience and different requirements in setting out the buildings vary so much.

The abominable practice of covering the edge faces of the brickwork with a rendering of cement stucco has obtained a great hold, and too much cannot be said in severe condemnation of the practice; and it is by the aid of this habit that result the cases of wretched deception before referred to. In many buildings it is a common method to cover a really good and thorough brickwork execution with this cement

jacket, and mark out with all the joints and other attendant features of solid stone, and plant on everywhere possible overdone cast cement ornament, and in some cases the deception is enhanced tenfold by painting and sanding in direct imitation of stone. All this then tends to debase brickwork, for when the knowledge exists that the outside is to be covered and hidden, but little attention is given to the facial appearance of the bricks and the method of laying them. When the general advantages of exposed brick surfaces are considered it is surprising that more attention is not given to their adoption. The impervious and vitrified surface of a hard, well-burnt brick is very little affected by the acidulating action of smoke and other fumes peculiar to cities and by the wearing effects of the weather, against all of which both ordinary stone and stucco are weak as a defence. And again the brick is a material that is eminently suited for construction on account of the facility with which it lends itself to the awkward complications and broken up nature of our modern buildings, nor can it be doubted that brick in conjunction with terra-cotta will be a large factor in the buildings of the future. As far as expense is concerned, bricks exposed are much less than stone and very little more than stucco. It should therefore be the duty of the designer to make the external appearance and the surface suitable to and in harmony with such construction. Boldness of form in which the brick is collectively considered should be relied upon rather than a frivolous ornamentation in which the brick is more individually apparent. The builder has at his command such improved methods of economically operating in late years, and as there is every chance of its improvement, it would seem that there is nothing to deter the designer from exercising more courage in setting out bold features, the economical execution of which in older times would have been a deterrent consideration. The Romanesque would seem to be a good model on which to found a design embracing a more characteristic use of the brick. There is in this style something which is strikingly bold, and by making the arch features more apparent, piers rather than columns, together with rejection of the smaller detail ornament, which crept into the late examples, and by a judicious unity in execution, at the same time making all materials—as, for instance, iron—fulfil their part in a harmonious manner, something more simple and more just to ourselves might be produced.

There have been erected recently in Sydney two notable examples of exposed brick surfaces, and one in particular has a most disappointing appearance; the whole effect is oppres-

sively flat and monotonous, brought about by the entire absence of any boldness of proportion, especially the mouldings of the strings and cornices, which are so ill-proportioned as to be hardly perceptible on the opposite side of the street. There can be no doubt that failures such as these have a very bad influence on the progress of the use of bricks. The work throughout was all that could be desired, as will be understood when it is stated that the facing joints did not exceed $\frac{1}{4}$ inch, and the bricks were not gauged or rubbed, but hard, double-pressed, as they had left the kiln. To an observer interested the lesson given by this example points out that if an effective result is desired it is most necessary that the design shall not rely upon small and insignificant moulds (good work notwithstanding), but rather upon the shaping of parts of the actual building into such forms as will insure effect in proportion, as will be seen in the case of the other of the buildings referred to, which has been treated in a bold manner by an execution in Romanesque. The piers and the fine arches, together with striking breaks and formations in the wall surfaces, and the attention given to colour harmony, cause one when looking at it to forget the brick as an atom and think only of the magnificent whole formed by its use. The knowledge is present to the most simple that it is brick, but there is, co-existent, the impression that the effect is excellent. In this case the architect has given some considerable attention to detail, of course rendered necessary by following closely the style, but it is not too much to say that had most of the detail been omitted the design would not have suffered.

The nature of the modern brick, on account of its hard and finished surface, renders it necessary to impress the mould before being burnt; and so far so good, for it is most desirable that the whole surface, plain and otherwise, of the buildings should be uniform, which would be a matter of impossibility were the attempt made to carve, cut or rob any particular portion, for which bricks less hard would have to be provided. But in this method of previous impression, advantage is taken of the easy method of production to indulge in excess, and the abomination of small and insignificant mouldings is the result. Mouldings which cannot be seen are abortive and useless in any material, and in this case what can be got in the brick itself cannot be carried out when laying it, and nothing looks worse than lines of moulding not perfectly straight and horizontal. The only remedy that remains when such occurs is to straighten up as much as possible by the aid of tuck-pointing. The only logical method of using bricks for mouldings is to

treat them as part of or one member of the mould, than to endeavour to get two or three members in each course of bricks. All attempts at the execution in brickwork of the Classic orders with columns and entablature should be avoided, and the massive detail rendered necessary by the adoption of the Renaissance renders failure certain unless a plentiful mixture of stone is used, which is not always possible.

Colour is a question that requires a great amount of attention when designing, and some of the huge mistakes which almost every city can complain of in the way of glaring examples of red walls lavishly interspersed with bands and all kinds of geometrical patterns in white brick should certainly be things of the past. There can be no doubt that in this particular some advance will have to be made in a general manner by the manufacturers, but it is very certain that none will take place till a firm demand is made by the designer; in fact, none can be expected if the user is content to manage with the result of a loose system, which, as far as colour is concerned, depends merely on what the clay likes to give. It must be confessed that the advance made in controlling the colour return has been nothing compared with what has been done in the fast production of a hard and well-shaped brick, and yet each is equally important and the end will not be reached till such is universally accomplished. By the aid of a little chemical science the clay might be treated in a manner capable of producing any of the ordinary tints, and there is no doubt that if the makers were convinced that the production of such was in their interests the want would soon be satisfied. It should always be remembered that those who help to make a city dull and oppressive by smoke-covered stone and sombre and crumbling stucco, and fail to take advantage of the chance to liven and beautify by the use of inviting coloured material, are to a great extent responsible for that absence of artistic feeling among the lay portion of the people which is so depressing. Nothing could give greater pleasure than tastefully selected and harmonious colours in architectural work, and it would be difficult to find a better means of artistically educating the people.

Iron.

Iron, however, much more than brick, on account of its new and different nature, has great cause to be dissatisfied with the mode of ornamental treatment it has received. Its special qualities as a building material have conferred such general advantages that it is a matter for regret we do not pay the

WORKS, ROTHERHAM, Estab. 1854.

attention to its appearance that we give to it in its purely useful capacity. The generous aid which it lends to us in the solution of our building difficulties and the manner in which, by its use, we are enabled to do so much that was hitherto impossible, surely demands that its worth shall cease to be covered by imitative and unsuitable designs. Who is the engineer or architect that has not had reason to be thankful for its aid, perhaps as a girder in getting over a troublesome span where intermediate supports would have been objectionable, or by its use as columns in the little lateral space taken up in proportion to the work done, and where by reason of its bulk stone would have been inadmissible? And yet in return the mean action is taken of covering up the iron girder with wood and cement, and by painting and sanding, making it look like a stone lintel, which could never have done the work. Or in the case of a column by moulding it after a Classic model, totally ignoring the very palpable fact that by its lean shaft all the proportions of the model are lost. On no account should any of the Classic columnar orders be applied to it, for if enough of iron is used to retain the usual proportions waste of material is bound to occur, and on the other hand if the use is made economically the ratio of thickness to height is sure to result in a sickly and lean effect. The advantage of iron is that it enables us to do the work required with much less bulk than if stone, brick or wood were used; therefore it is contended that it is contrary to the ethics of good design to make it appear like those materials when doing its superior work. In the case of the girder or truss surely there can be no logical objection to their straightforward exposure. The rivets and the L irons could easily be left to make a presentable appearance. An example of a girder exposed is to be found in the front of a recent large building erection in Sydney, and it must be admitted that its calm, dignified and straightforward appearance is not unpleasing. The flanges and L irons have been carefully worked, and the heads of the rivets left very clear; but beyond this there is nothing in the way of ornamentation, and none is wanted, for where it has to do laborious work a simple but effectual appearance is the best, and it would be entirely out of place to fancifully ornament it. Deference must of course be paid to the necessity for sheathing the iron columns and girders with fire-resisting material; but this is not always necessary, for there have been one or two examples of iron columns and girders so constructed and arranged that by means of a fusible plug in case of a fire, a continuous stream of cold water will circulate throughout them, provision also being

made that all cradles and seatings should have similar benefit.

Wrought-iron is capable of lending itself to very delicate and artistic treatment, and recourse to it should always be taken to give the necessary contrast to the heavier and more substantial construction. Gates, grilles, railings, finials, &c., are excellent chances to treat in a light way, and the most beautiful results can be obtained. Wrought-iron also enables the architect to do much in the way of roof effects. Every designer can appreciate the addition to the proportions of a building which a raised and curved roof makes, and the strength and pliability of wrought-iron in every way conduces to the easy attainment of such roofs. Sir Gilbert Scott, in "Gothic Architecture, Secular and Domestic," expresses the opinion that "there can be no doubt that the iron roof is susceptible of exquisite beauty." And it would indeed be difficult to prove the contrary. But unfortunately it is seldom that even an attempt is made to gain such a result. It is, however, in its cast state that most of the anomalies exist. At the present there is a term "cast-iron impudence," which is freely used, and actually it might be suggested that it had its origin in the glaring and impudent manner in which cast-iron ornament is plastered over our buildings. It is not going too far to say that almost 80 per cent. of recent erections in the colonies have in some way been made to rely on this stuff for appearance, and yet at the same time it would be impossible to find more than about six different designs amongst the whole. In every city and town is to be found the cast-iron shop, the keeper of which has set out on the walls the same monotonous display of specimens to be found in every other place of a like nature. He calls each design by some fanciful but totally inappropriate name. He sells it by the foot, it is put up by the foot, and the result is a never-ending array of yard after yard of cast-iron, so utterly bereft of any variety or beauty as to be positively offensive to a tasteful eye and totally stamp out even a spark of regard for cast-iron. It is not only the want of variety or beauty in the design, but also the roughness of the casting, no care being taken to preserve a good surface or sharp-edges, and the casting very often appears a confused mass of dots and lumps. It must not be thought that the purpose of this paper is to entirely condemn the principle of treating it for ornamental purposes; but some improvement might be made with advantage in the habit of making in cast-iron an attempt to resemble, for instance, ferns or other vegetable forms. Cast-iron should not be used for purposes of ornamentation only,

but rather primarily as meeting a necessity and then ornamented to make presentable. As an instance might be taken a column in a store, the plain shaft of which, together with a simple and unostentatious cap merging into a cradle with bracing studs, is far better and more in place than to have an elaborate thing in Corinthian style put in somewhere in the front, with no other reason for its existence than that it is intended to make a nice appearance; or again, would it not be far better to just have a little, but suitable, wrought-iron work, judiciously used, than all the cast-iron fringes, crests, brackets and finials which are so unmercifully used? Cast-iron is best used only when compressive strain is to be resisted, and in such cases it should be very unostentatiously beautiful. If used only for ornamental purposes, the greatest care should always be exercised not to indulge in an excess which is so tempting on account of the ease with which such is produced. All materials which allow of being moulded or cast, and thereby easily multiplied, conduce to quantity in large proportion, to trouble in production, and human nature is so fond of display that the inevitable result is overbearing and debased ornamentation, not so much the consequence of itself in its parts being bad, as because of being in direct violation of the rule, "that of the best we may have too much."

By the foregoing the author hopes to have made as clear as such a short paper can allow that engineers and architects have not done justice to iron and brick when designing for appearance in these materials. The remarks made in the beginning as to the course followed by the Greeks in the development of their styles will have to be taken to heart, and the silent advice given out by their example followed out by those who have to do with our architecture of to-day and in the future, and so long as a harmonious unity in design and material is aimed at, so long will this problem present itself to the designer who attempts to adapt new material to the exigencies of ever changing modern architecture.

COMBERMERE ABBEY.

INSTRUCTIONS have been received by Messrs. E. & H. Lumley, of St. James's Street, in conjunction with Messrs. Osborn & Mercer, from Viscount Combermere to sell the Combermere Abbey Estate, in Cheshire and Shropshire, and the sale will take place at the Mart on July 11. This estate comprises about 9,000 acres, chiefly old pasture used for dairying pur-

poses, and the rental is about 16,500*l*. The abbey is said to have been built in 1133, and, although the exterior has been much altered, parts of the interior remain in their original condition, and some of the walls are 5 feet in thickness. After 400 years in the possession of the Benedictines, the estate was granted by Henry VIII. to Sir George Cotton. The abbey stands beside a natural lake, about two miles long and 134 acres in extent, and is surrounded by 1,000 acres of finely-timbered park. The abbey is situated about three miles from Wrenbury Station, which is on the estate, and twelve miles from Crewe. It may be mentioned that the house was occupied for two hunting seasons by the Empress of Austria.

PATENTS.

[This List of Patents is compiled specially for this Journal by Mr. G. H. Rayner, of the firm of Rayner & Co., Consulting Patent Agents, 37 Chancery Lane, London, W.C., from whom all particulars and information relating to Patents may be had gratuitously.]

APPLICATIONS FOR PATENTS.

- 11476. William Reid, for "Improved equilibrium valves."
- 11525. Philemon Zahringer, for "An improved fire-escape."
- 11570. Thomas F. Clark, for "Adjustable packing-block and lifting-jack for short distances."
- 11572. Benjamin Pounder, for "Improvements in hinges or pivots and their mountings for desks, lockers and the like."
- 11632. Joseph Crawhall Chapman, for "Improvements in draught appliances for smoke-stacks and the like."
- 11681. George Worrall, for "Certain improvements in door locks and night latches."
- 11690. John Robinson, for "An improved smoke consumer."
- 11704. Thomas Edward Philips, for "The independent action ball and valve."
- 11776. Charles Ross, for "The safety door-fastener."
- 11953. Frederick Baker, for "Improvements in fire-guards."

TO INVENTORS. — Patents for Inventions, Trade-marks and Designs secured; every assistance given to inventors. Specialists in Building matters. Information free. — Messrs. RAYNER & CO., Patent Agents, 37 Chancery Lane, London, W.C.

WITHOUT KITCHEN FIRE, HOT WATER INSTANTLY, NIGHT OR DAY.

Boiling Water in a Minute. Warm Bath when Wanted.

"THE SALISBURY."
